Rick F. van der Lans

Rick F. van der Lans is a highly-respected independent analyst, consultant, author, and internationally acclaimed lecturer specializing in data warehousing, business intelligence, big data, and database technology. He is managing director of R20/Consultancy BV.

He has presented countless seminars, webinars, and keynotes at industry-leading conferences. Rick helps clients worldwide to design their data warehouse, big data, and business intelligence architectures and solutions and assists them with selecting the right products. He has been influential in introducing the new logical data warehouse architecture worldwide which helps organizations to develop more agile business intelligence systems.

He is the author of several books on computing, including his new *Data Virtualization: Selected Writings* and *Data Virtualization for Business Intelligence Systems*. Some of these books are available in different languages. Books such as the popular *Introduction to SQL* is available in English, Dutch, Italian, Chinese, and German and is sold world wide. He also authored numerous whitepapers for vendors.

In 2018 he was selected the sixth most influential BI analyst worldwide by analytica.com.

Challenges, Wishes and Requirements

- Accelerating the implementation of *cross-system analysis systems*
- Accelerating the implementation of *cross-organization analysis systems* (open data)
- Simplifying the *synchronization of source systems*
- Increasing the transparency of data processing for *process/decision reconstruction*
- Increasing the *discoverability* and clarity/meaning of data
- Improving *data quality*
- Strengthening *data security* and *data privacy*
- Strengthening *data history*
- Handling unstructured data: video, sound, text, and images
- Simplifying the data processing landscape
- Smarter uses of new technology

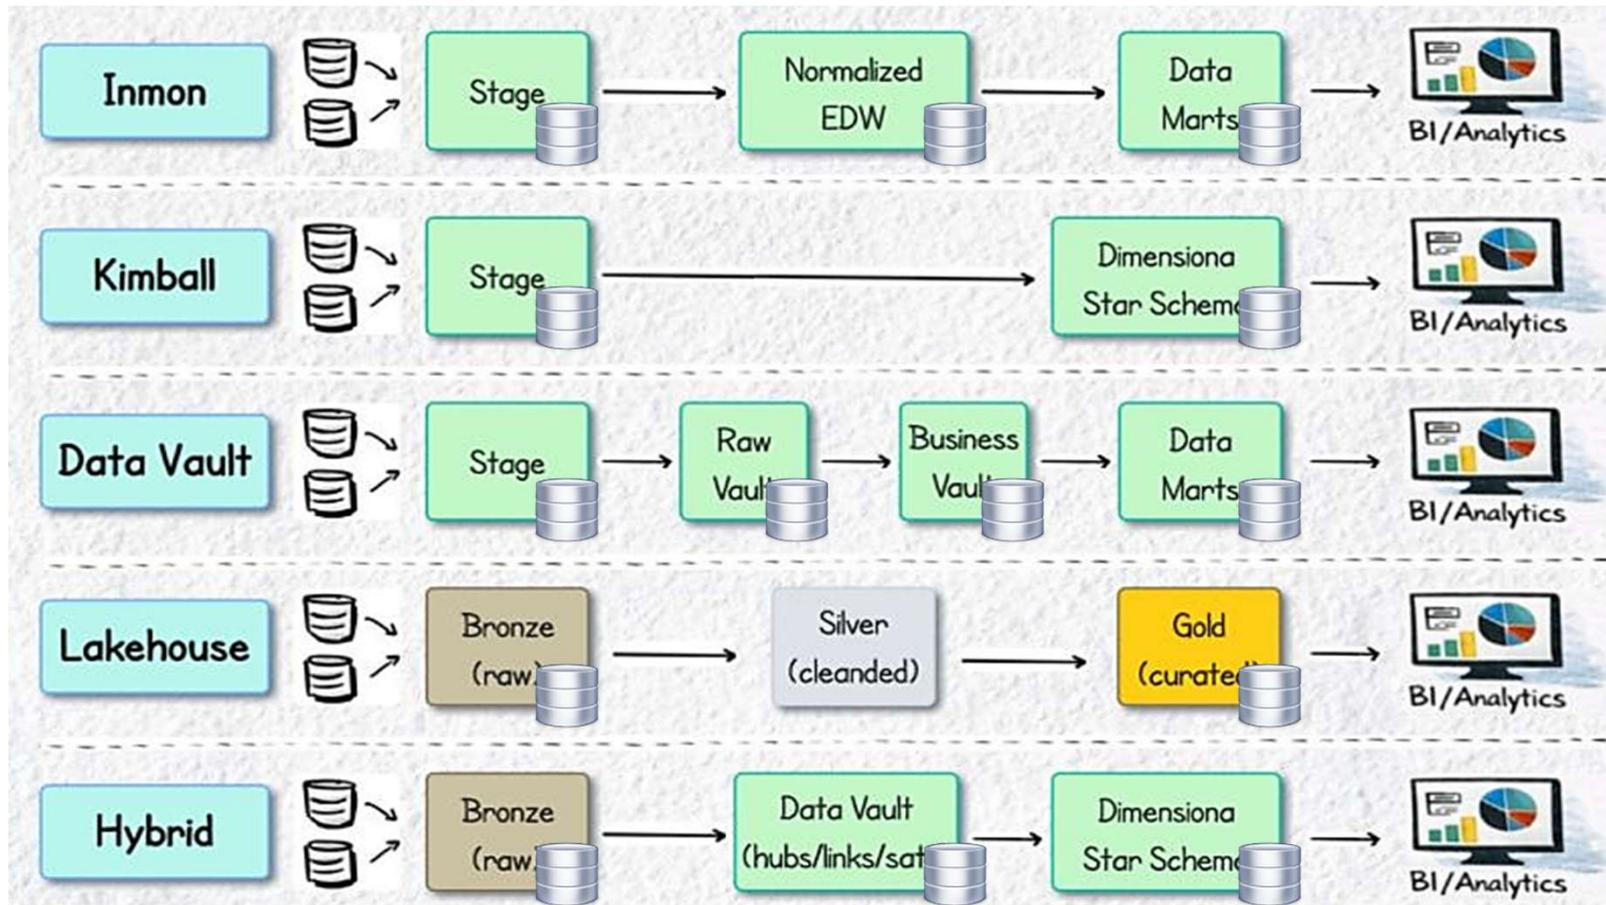

Example of Horizontal Lineage With Versions

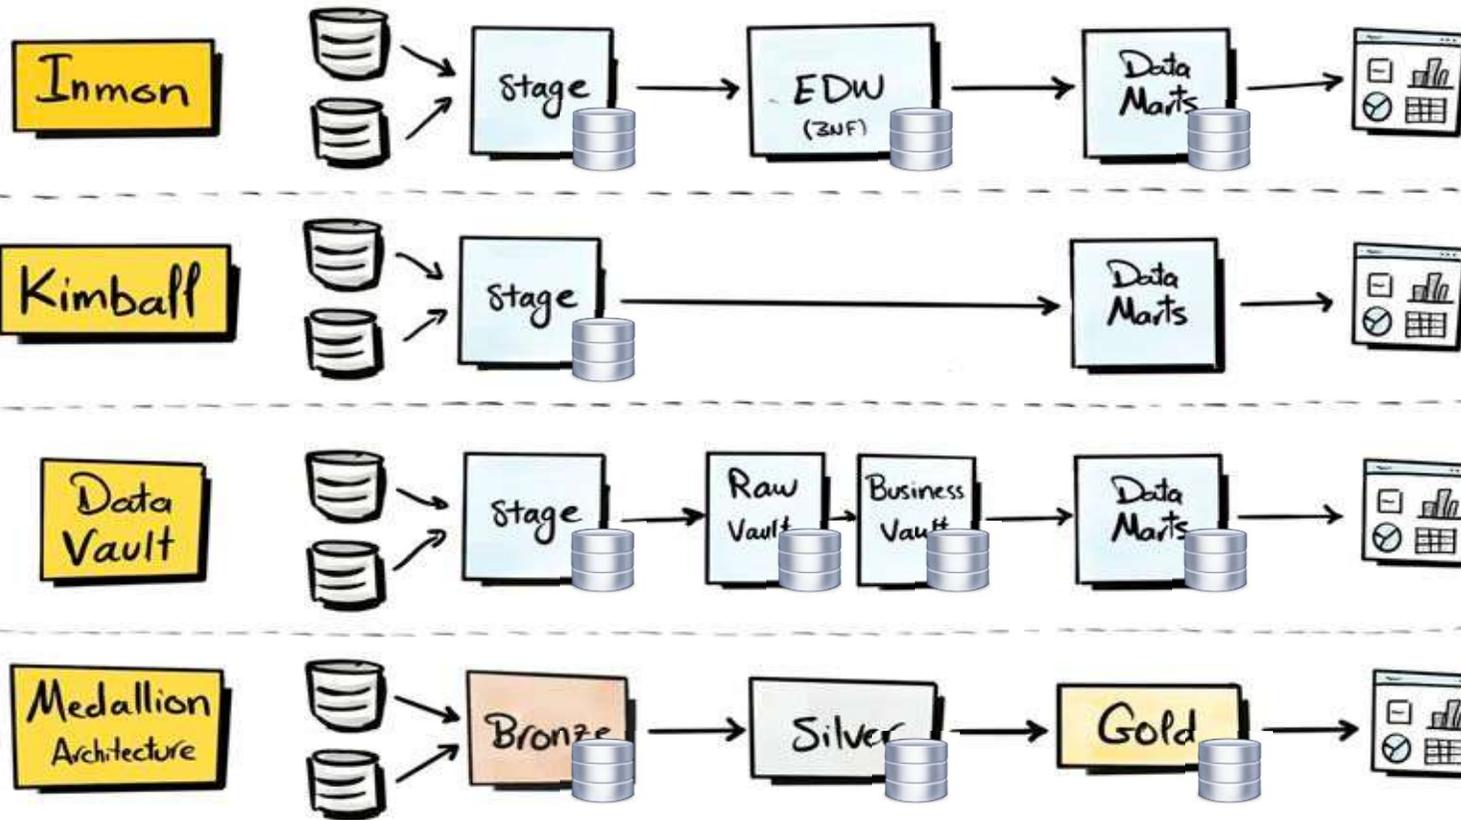

Example of Operational Lineage

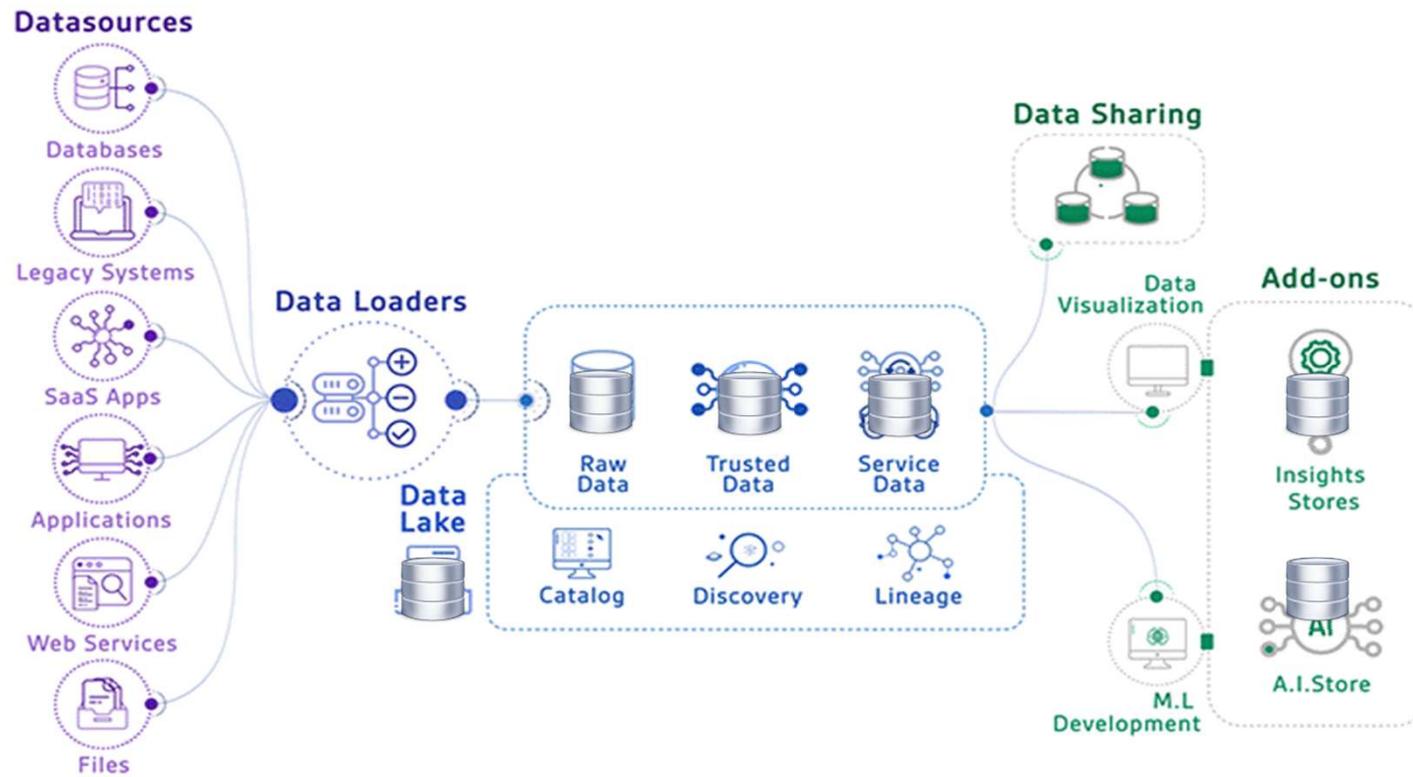

Domain Data Architectures (1)

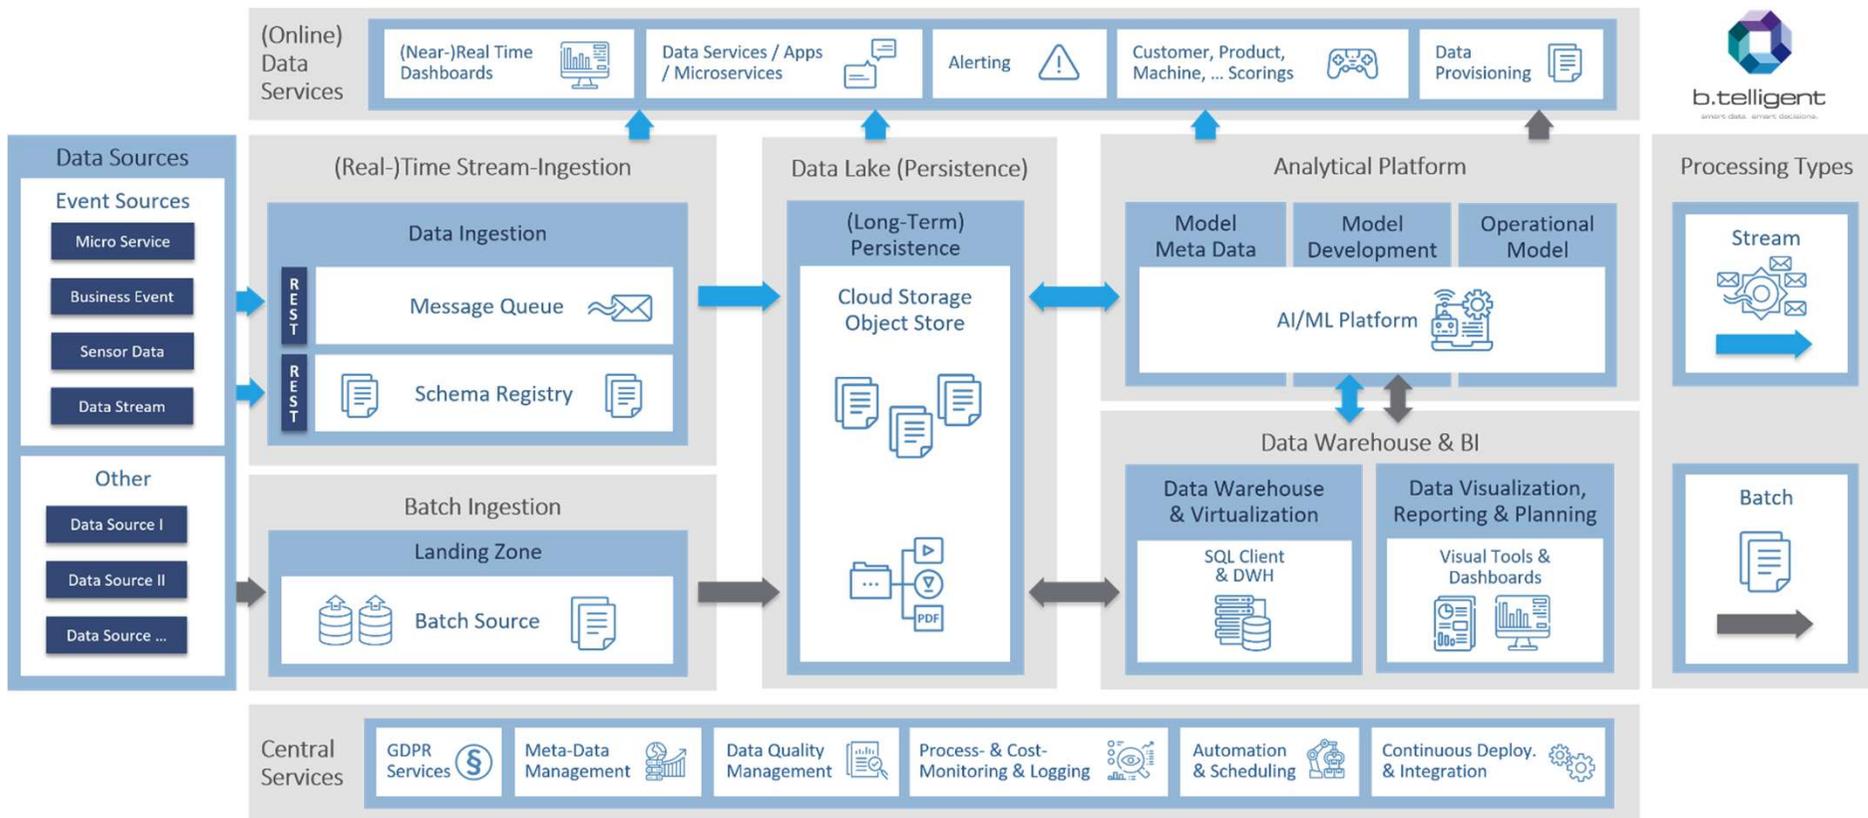

Domain Data Architectures (2)

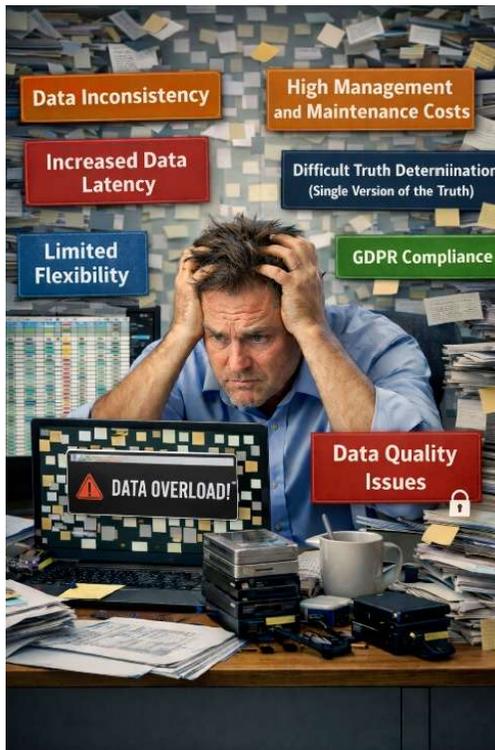

Domain Data Architectures (3)

Data-copy Rich Data Architectures

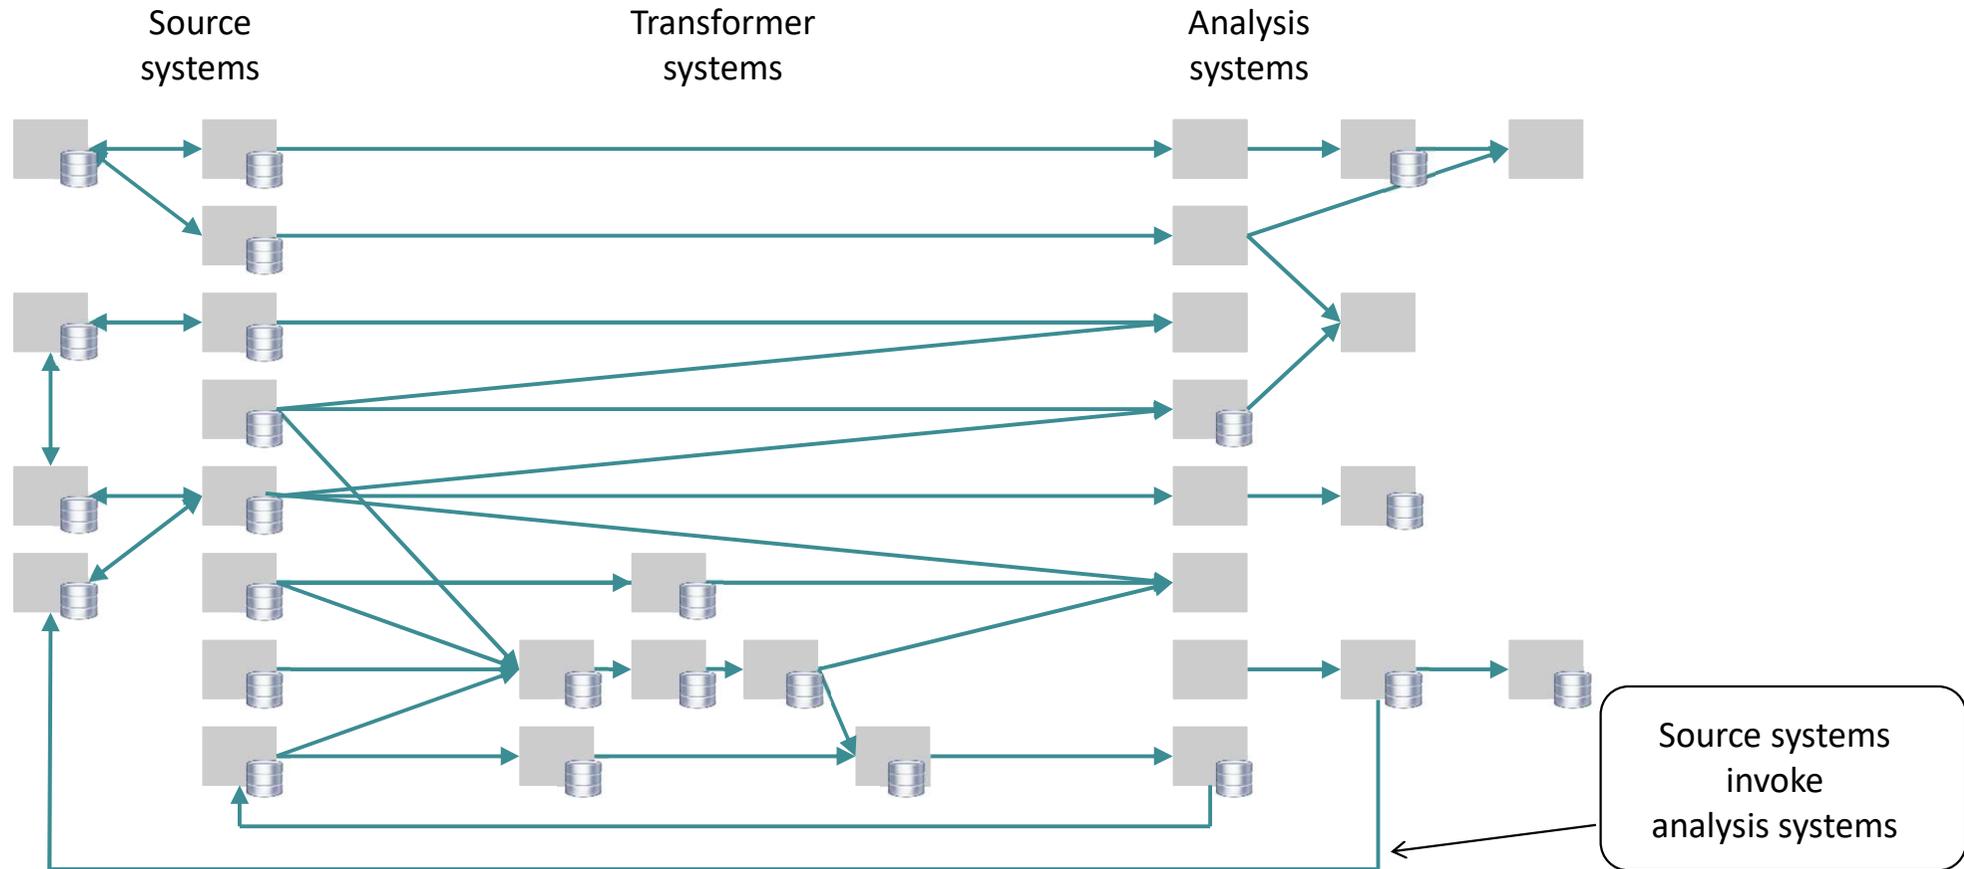

Disadvantages of Data Copying

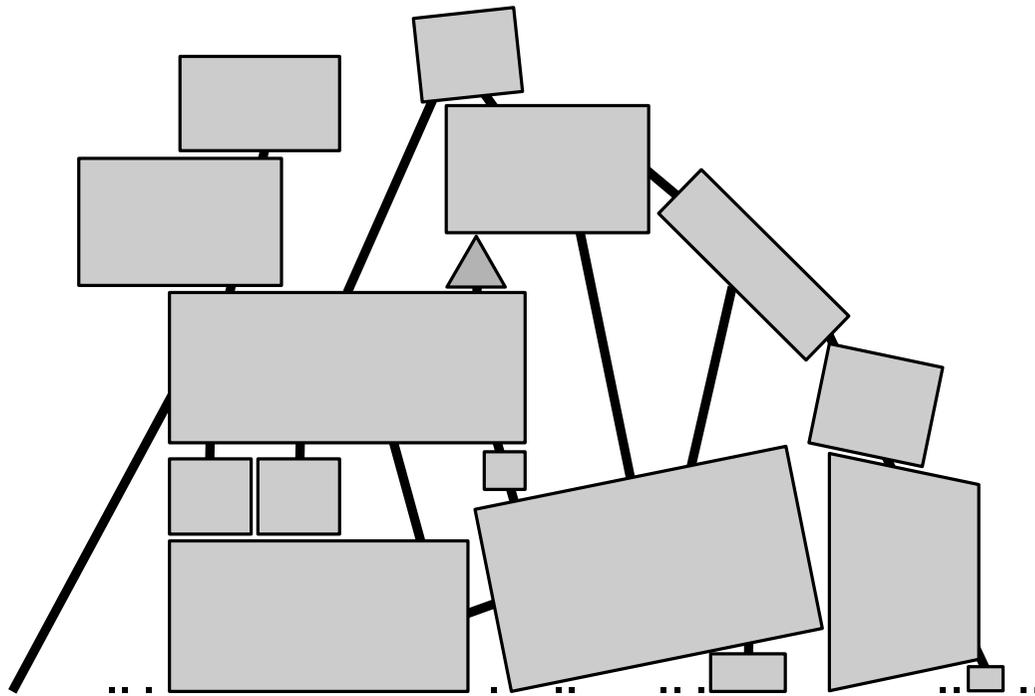

- Data inconsistency
- Difficult determination of the truth (“single version of the truth”)
- Limited flexibility and agility
- High management, development, and maintenance costs
- More complex compliance with General Data Protection Regulation (GDPR)
- Complex data synchronization issues
- Data quality challenges
- More complex data security
- Outdated data (increased data latency)
- ...

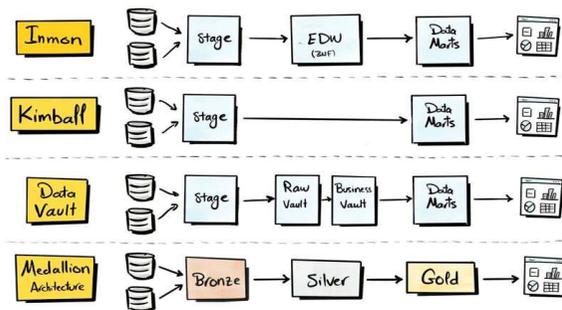

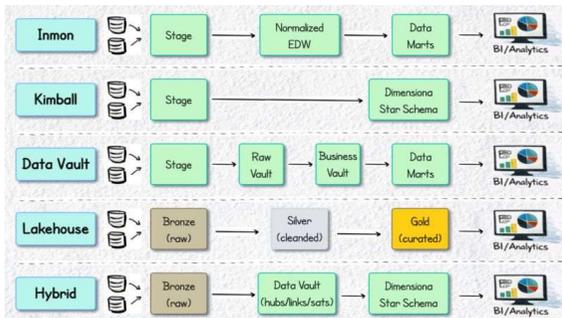

Evolution of the Data Processing Landscape

“Wobbly” Foundation of the Data Processing Landscape

Limitations of Some Data Architectures

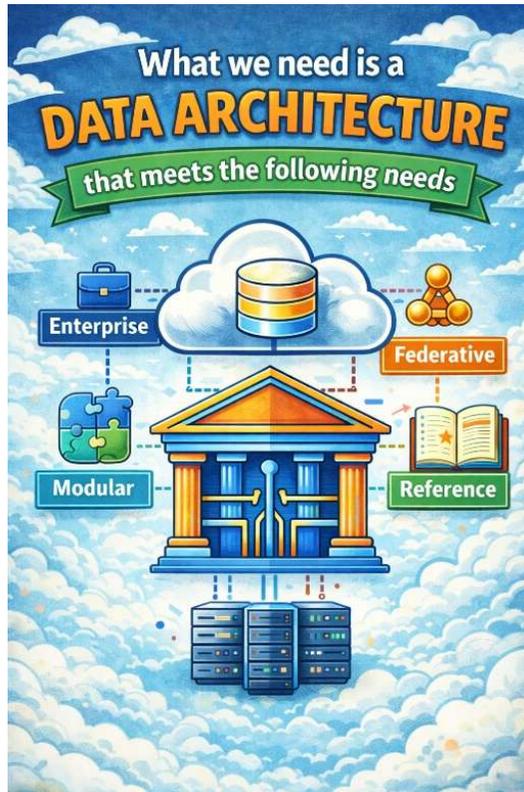

- Source systems are unjustly out of scope
 - Old and inflexible
 - Software packages
 - No IT sovereignty
 - No or limited data history
 - Poor data security
 - Complex data synchronization
- Analysis Systems are unjustly out of scope
 - Many data copies
 - Not under control of IT
 - Analysis models input to source systems
- Many requirements are unjustly out of scope
 - Reconstruction
 - Metadata for everyone
 - Data-sharing

Bring Your (Data)House in Order

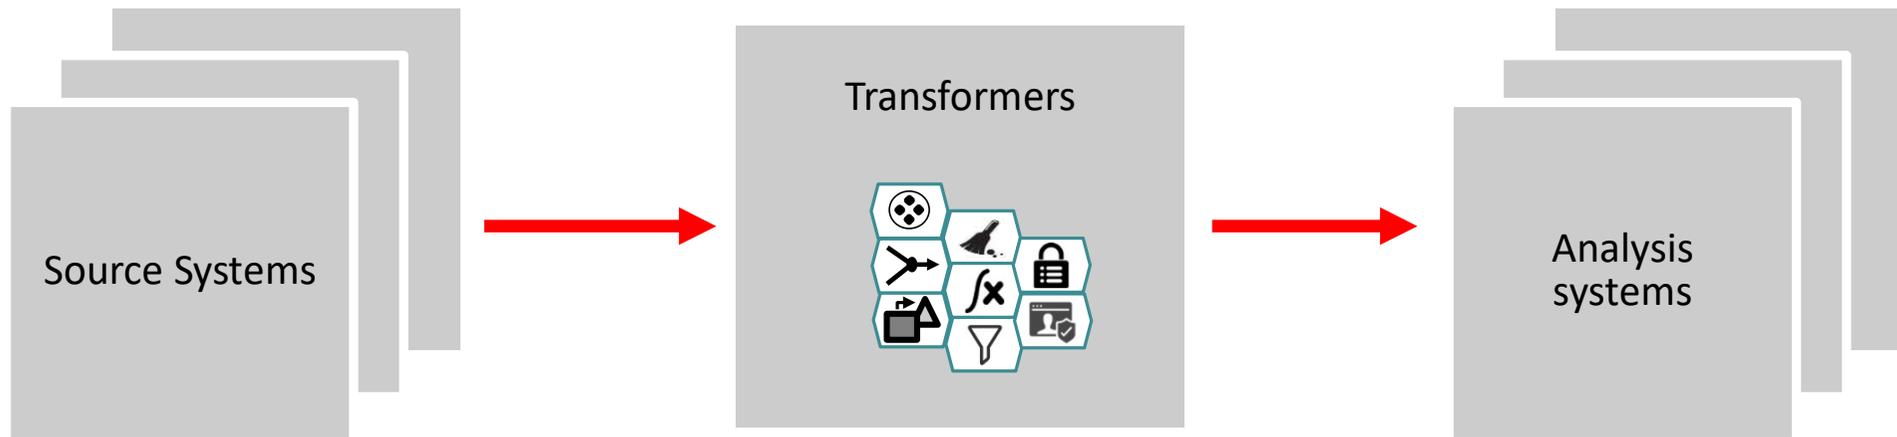

- Data in order
 - Metadata in order
 - Lineage in order (origin and impact)
 - Reconstruction in order
 - Data security in order
 - Technology in order
-
- It all starts with *data architecture in order*

What We Need is a ...

- *Enterprise* data architecture
 - Not a domain data architecture
 - Covers the entire data route
 - Not only focused on analysis and data science (and AI)
- *Modular* data architecture
 - Think big, act small
- *Federative* data architecture
 - Data storage minimization – less data copies
- *Reference* data architecture
 - Generic, reusable

Start with Transformers, Not With Databases

Duplicate Transformers in Analysis Systems

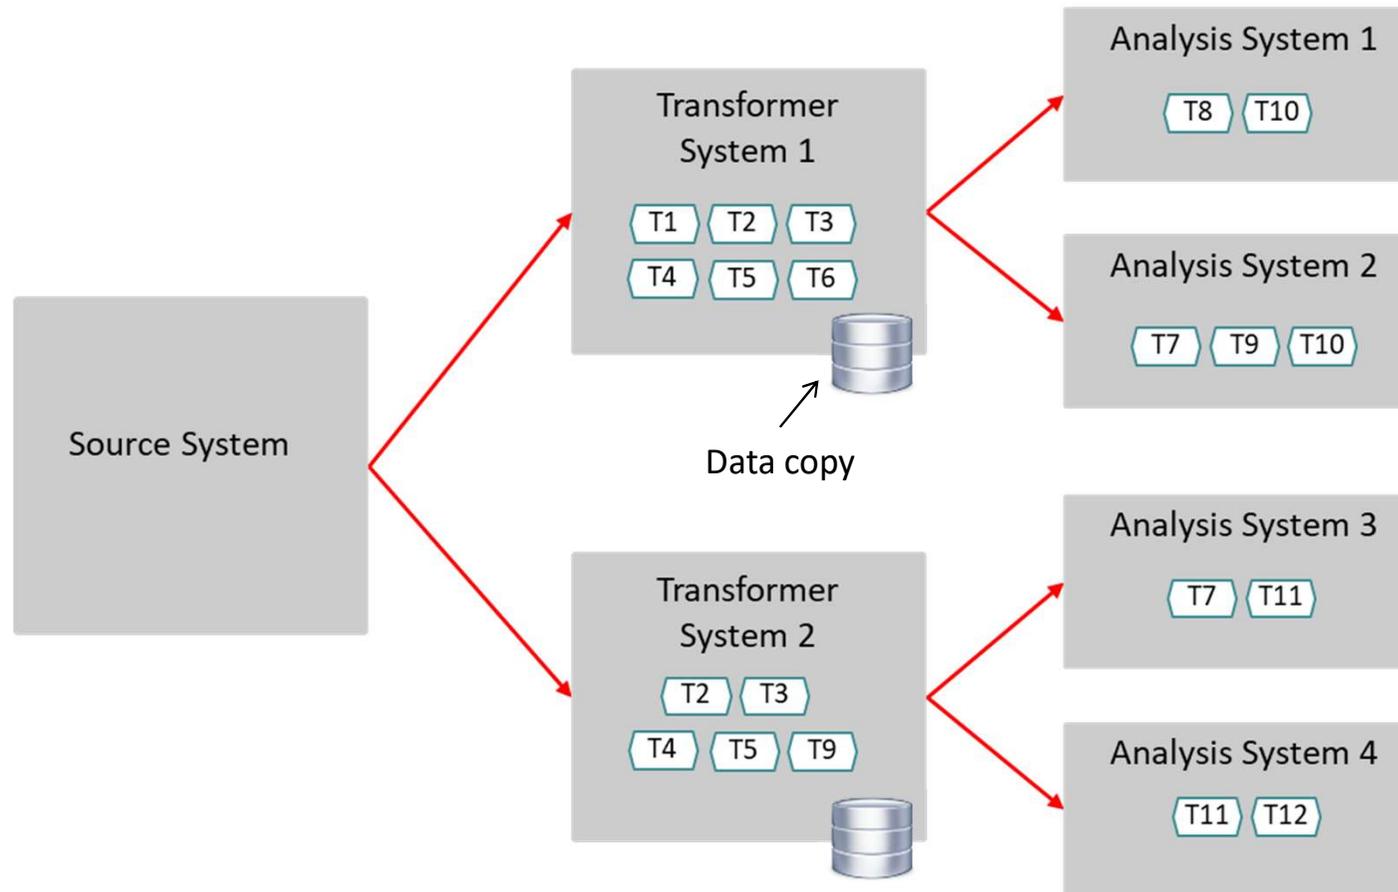

Centralizing Transformers

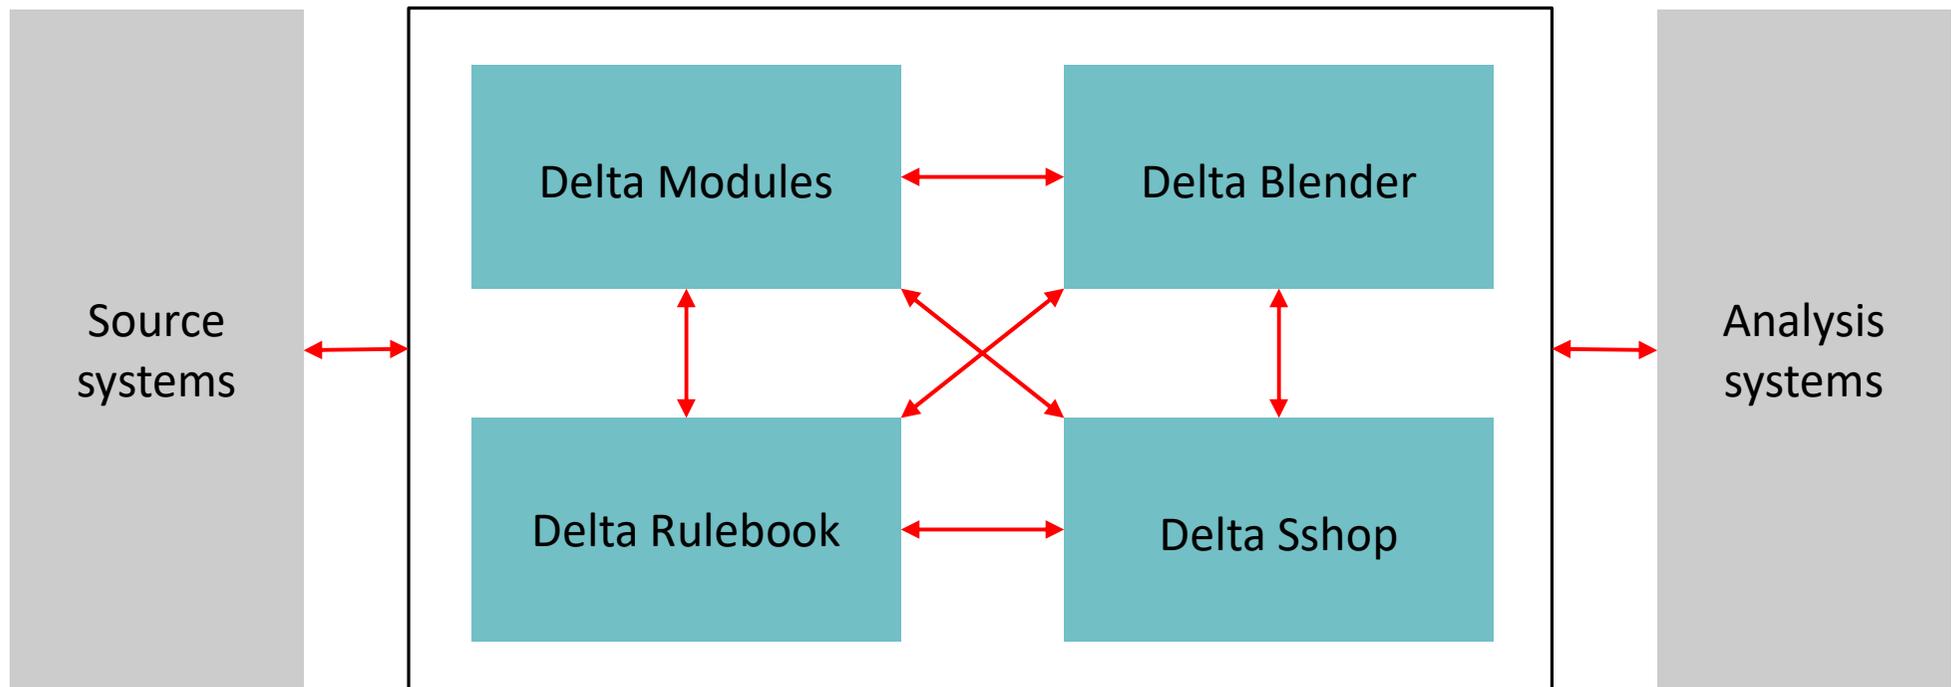

A Traditional Data Warehouse Architecture

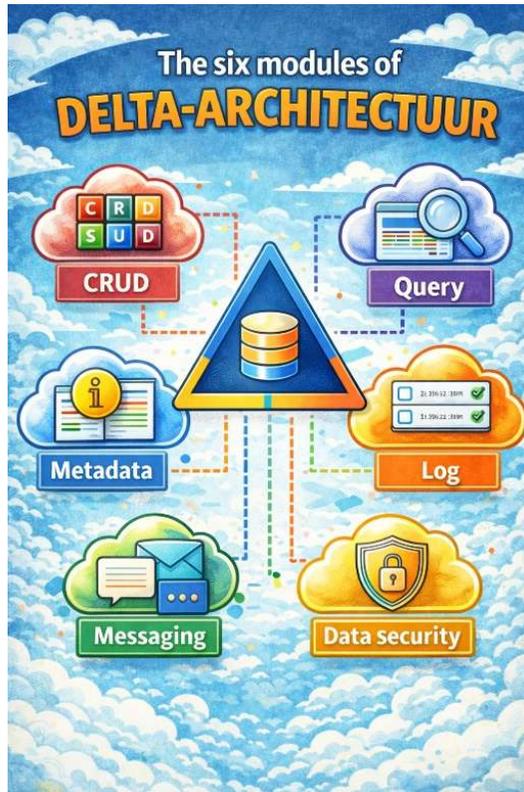

Duplicate Transformers in Transformer Systems

Delta: A Modern, Enterprise Data Architecture

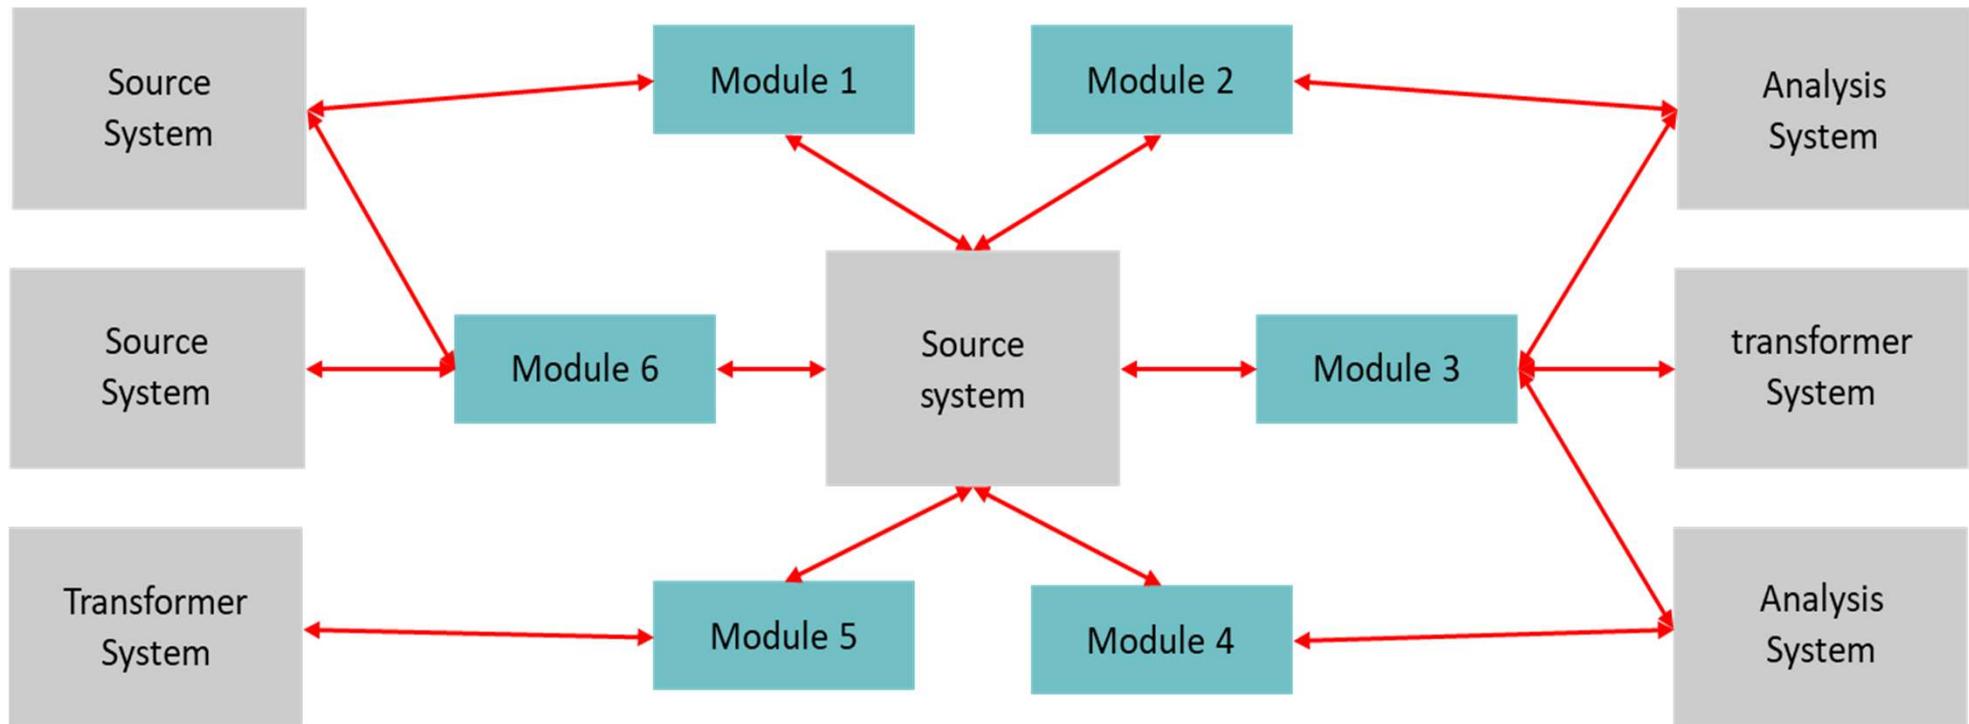

Six Delta Modules

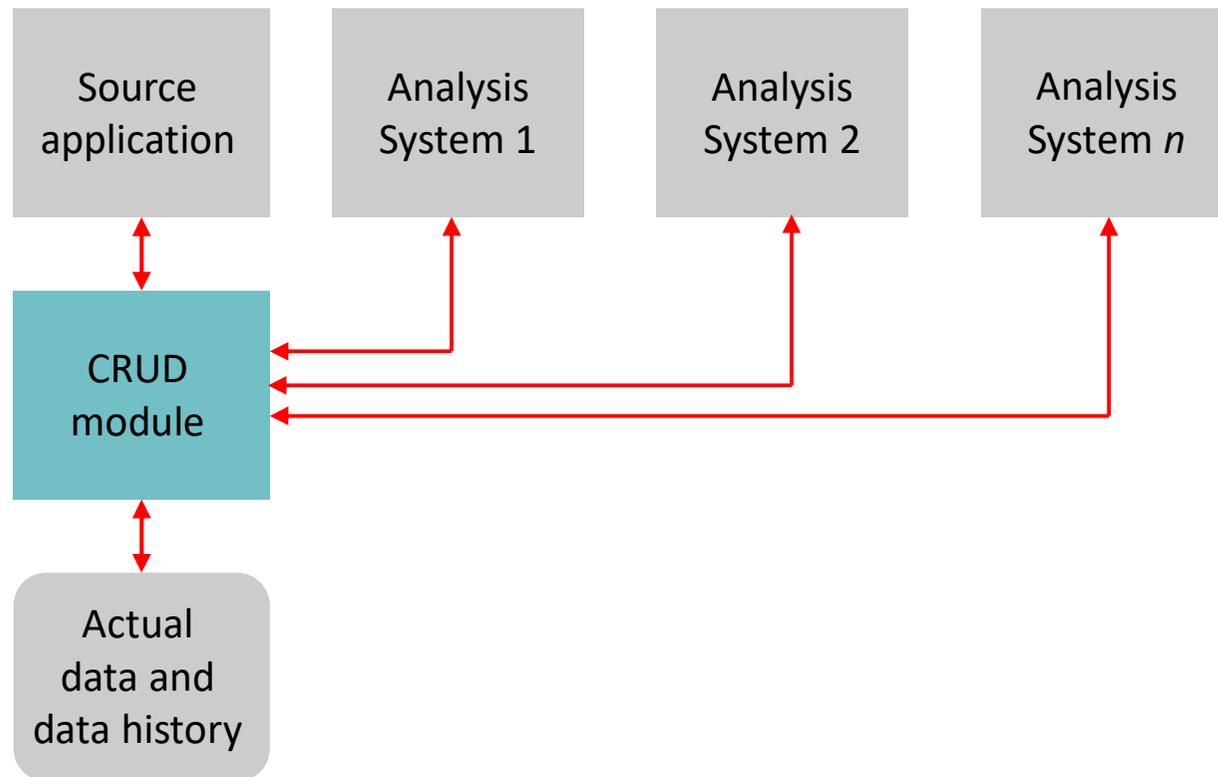

- CRUD
- Query
- Metadata
- Log
- Messaging
- Data security

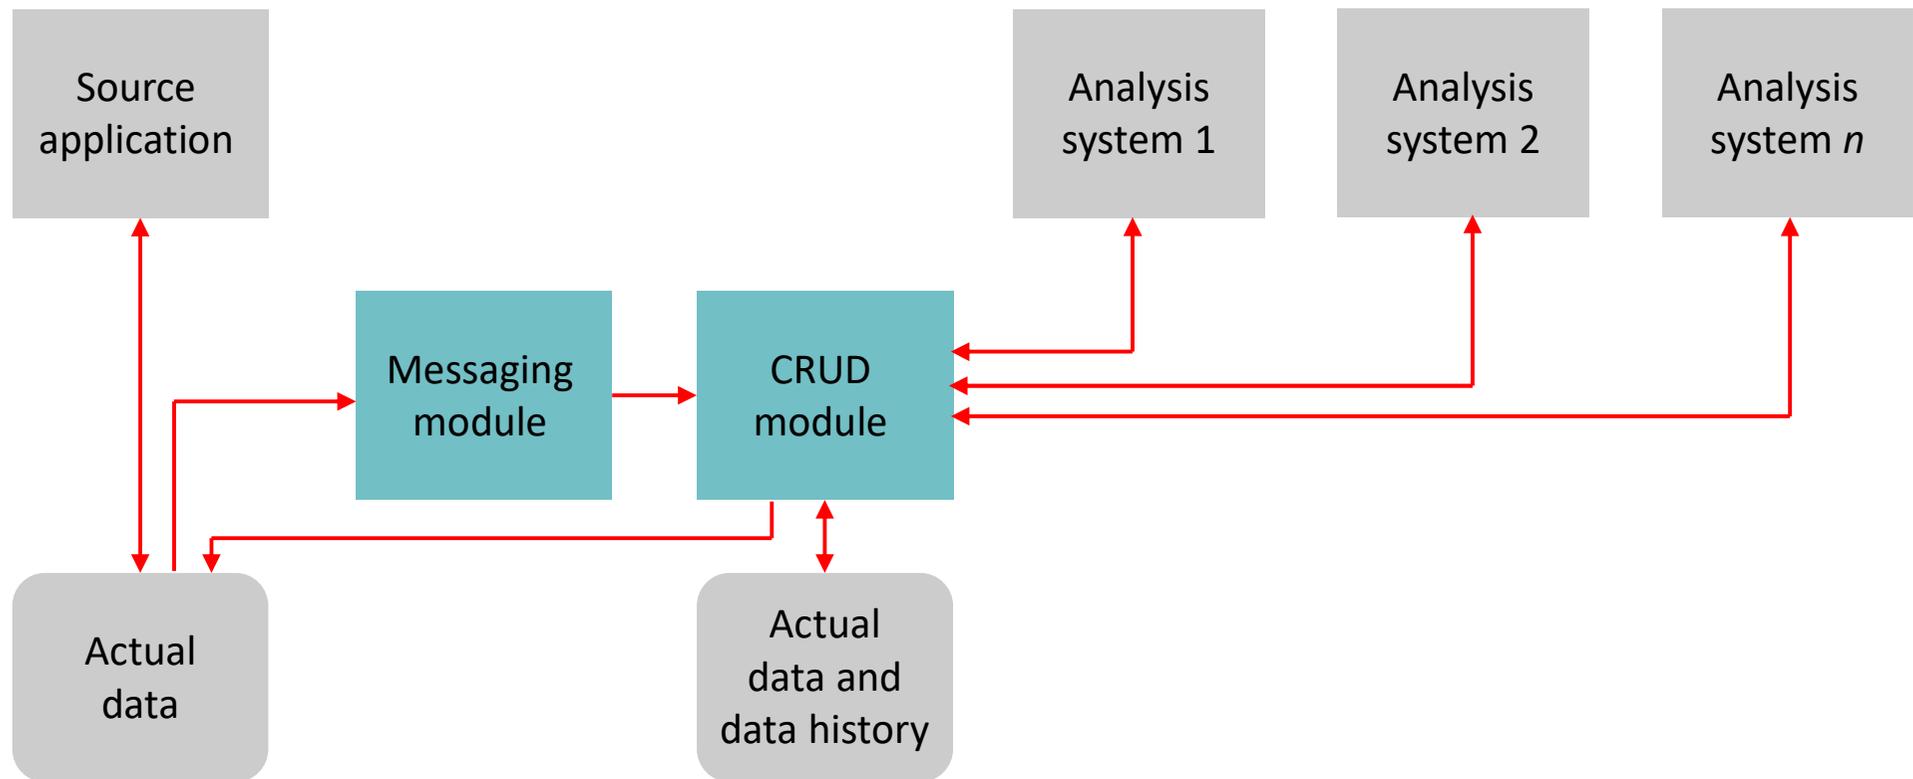

Wrapping the Source Systems - Abstraction

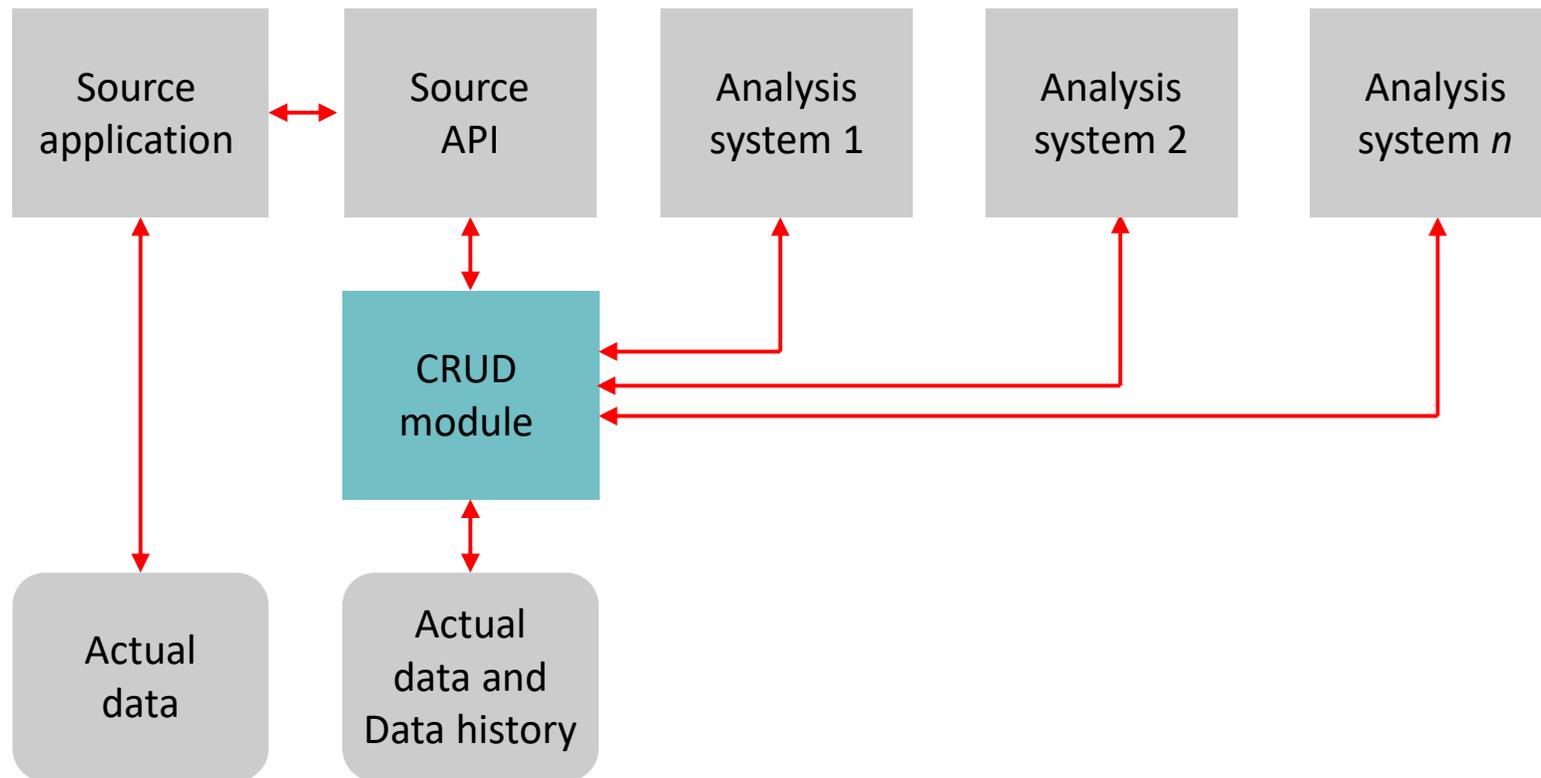

CRUD Module (1) – The Dream

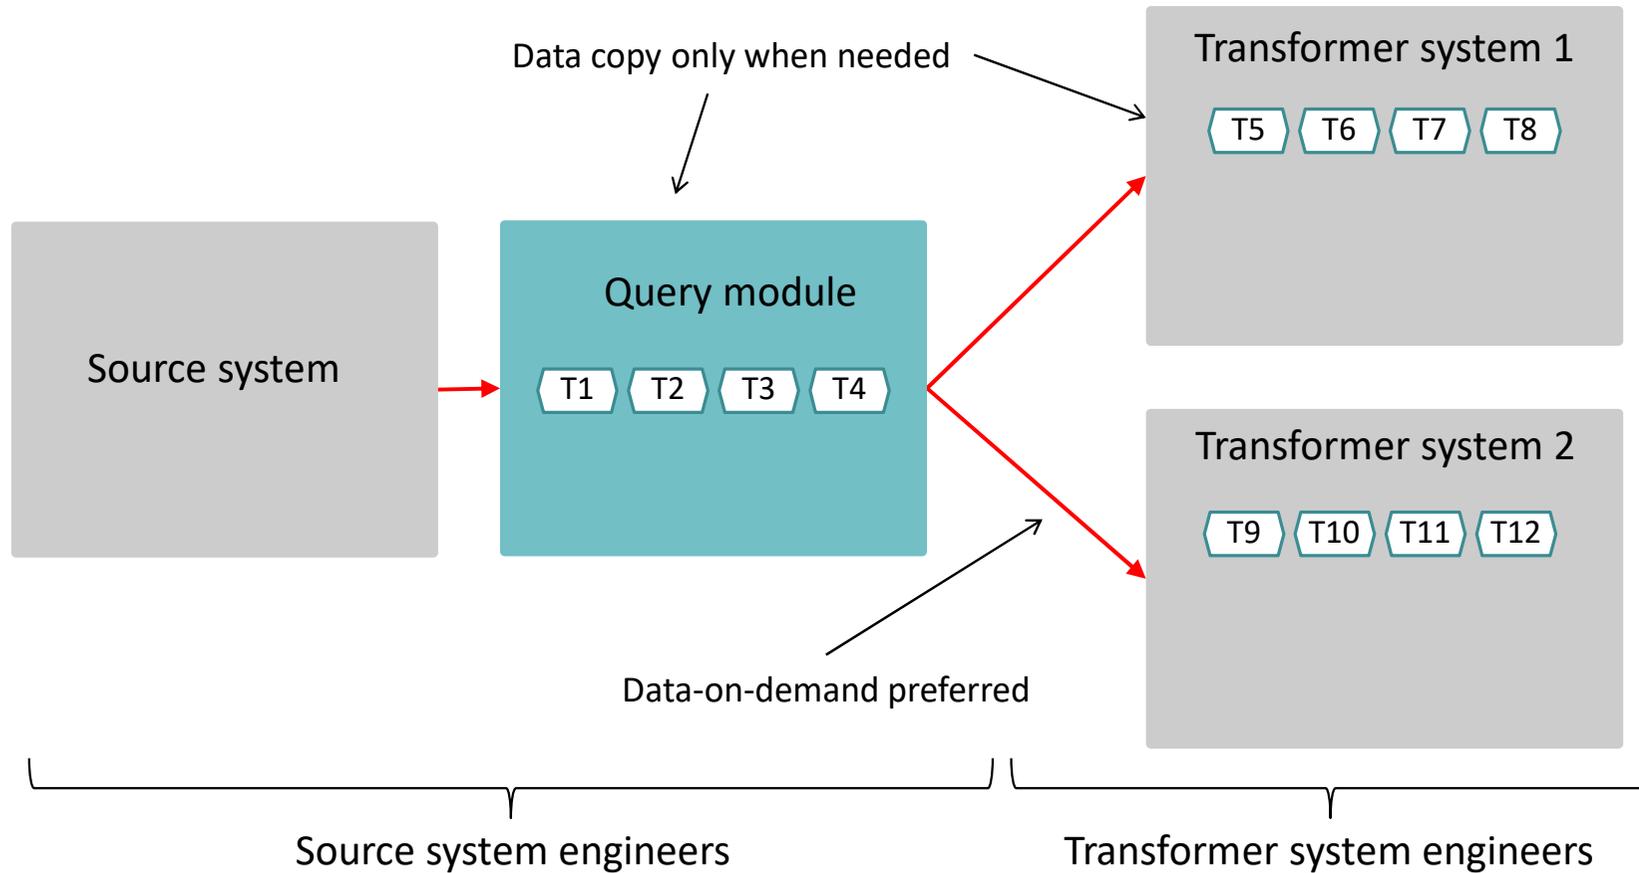

CRUD Module (2) Via Meesaging Module

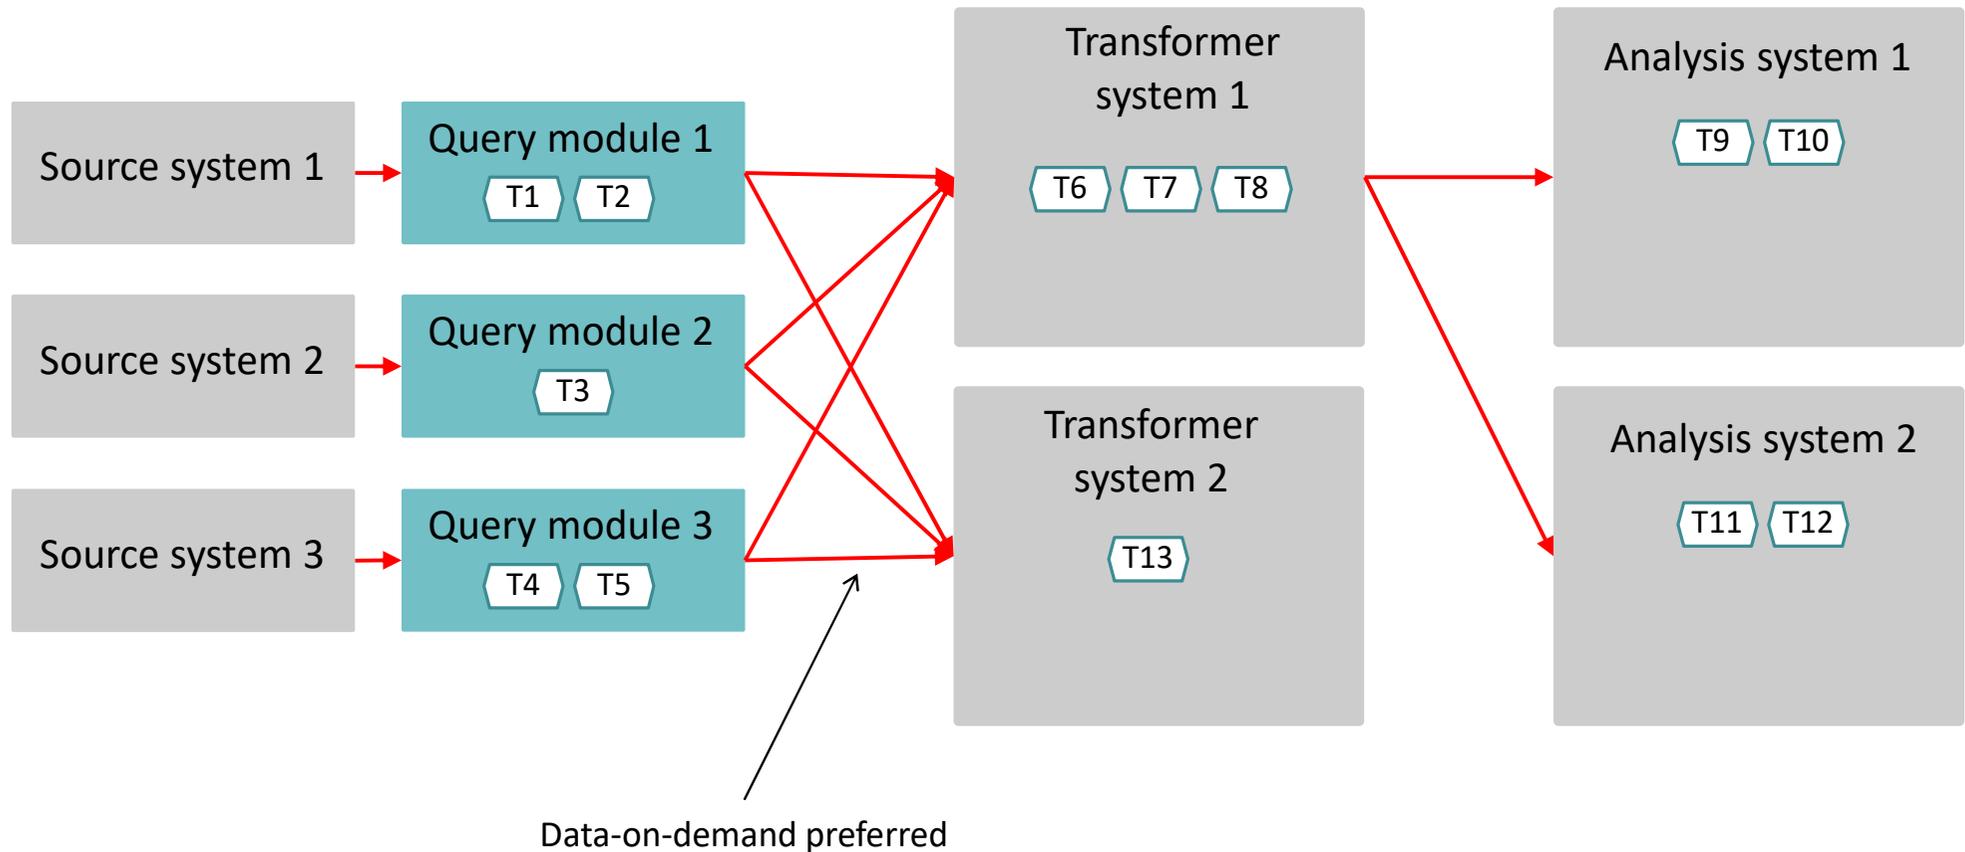

CRUD Module (3) Via API of Source System

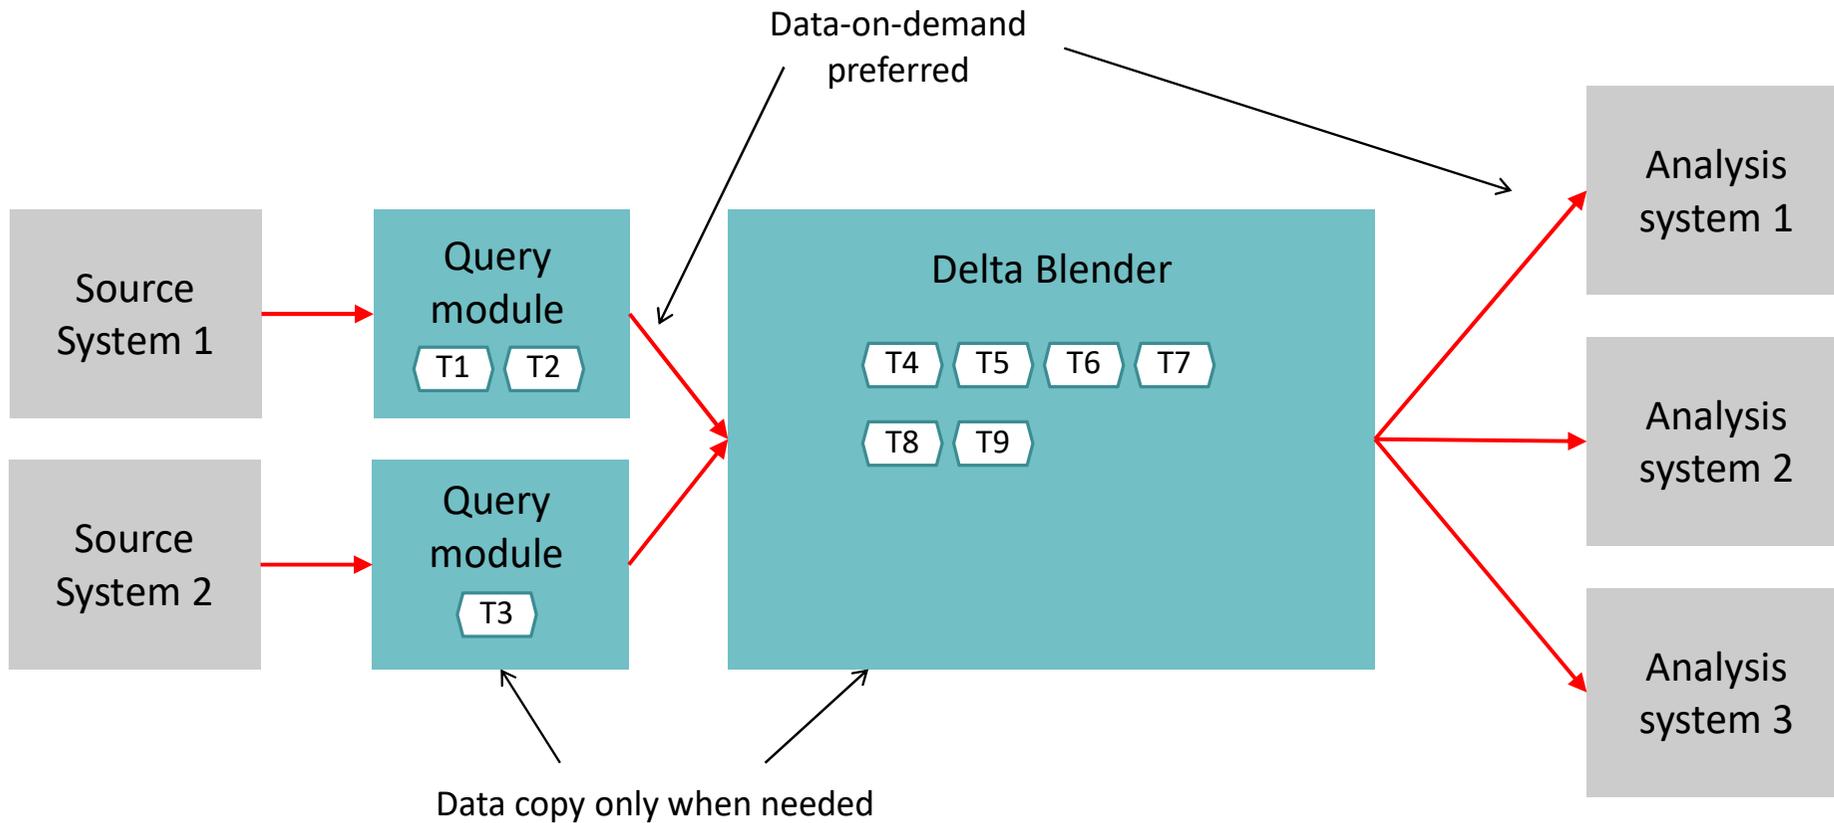

Transformers Closer to the Source Systems

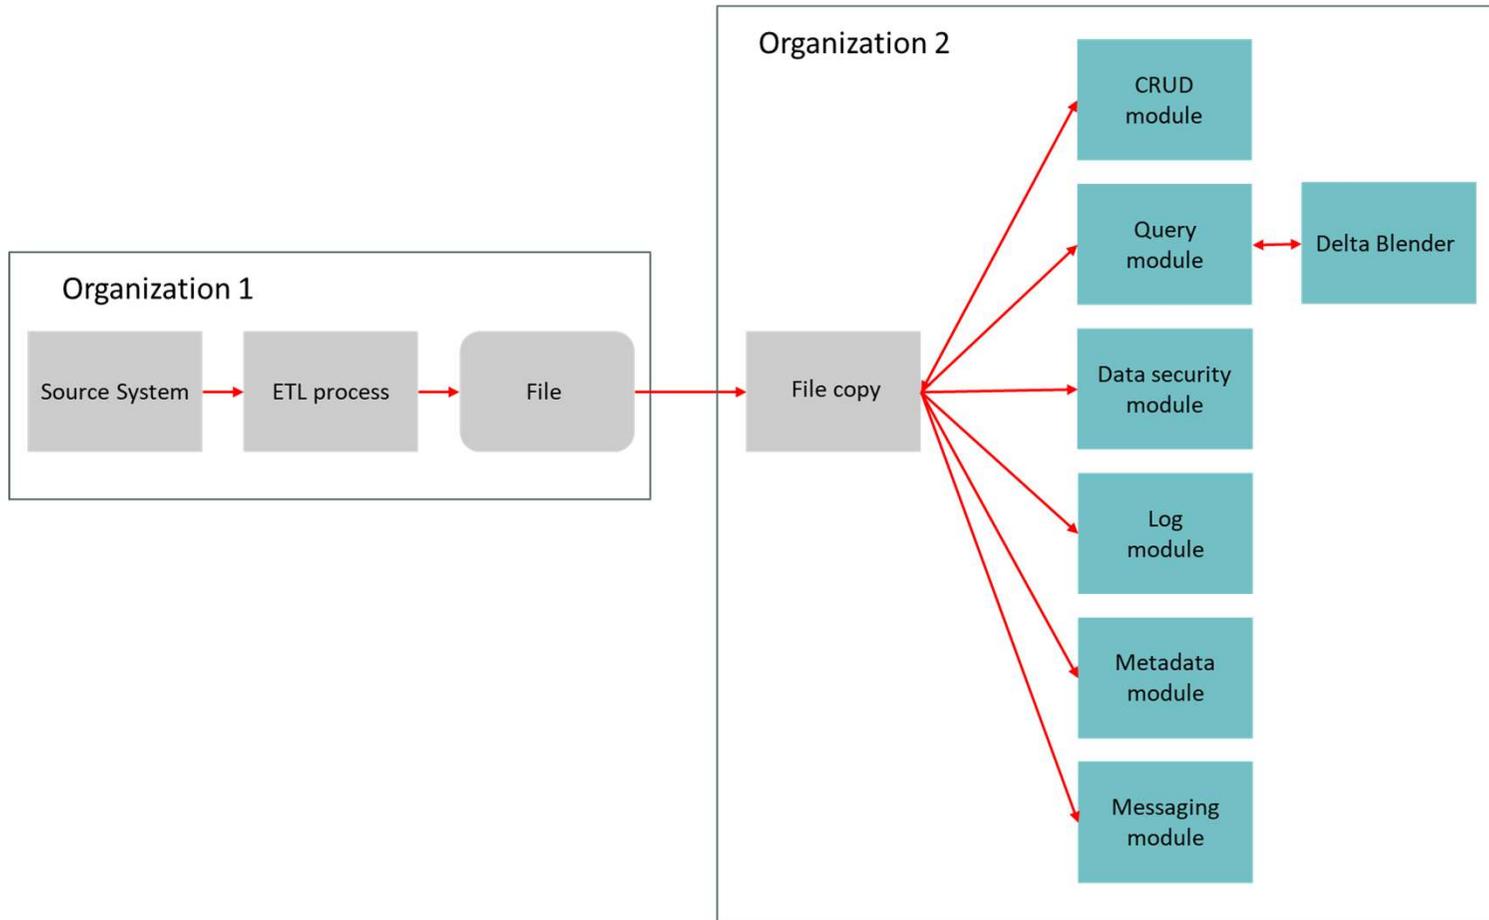

Transforming Data in Delta Modules

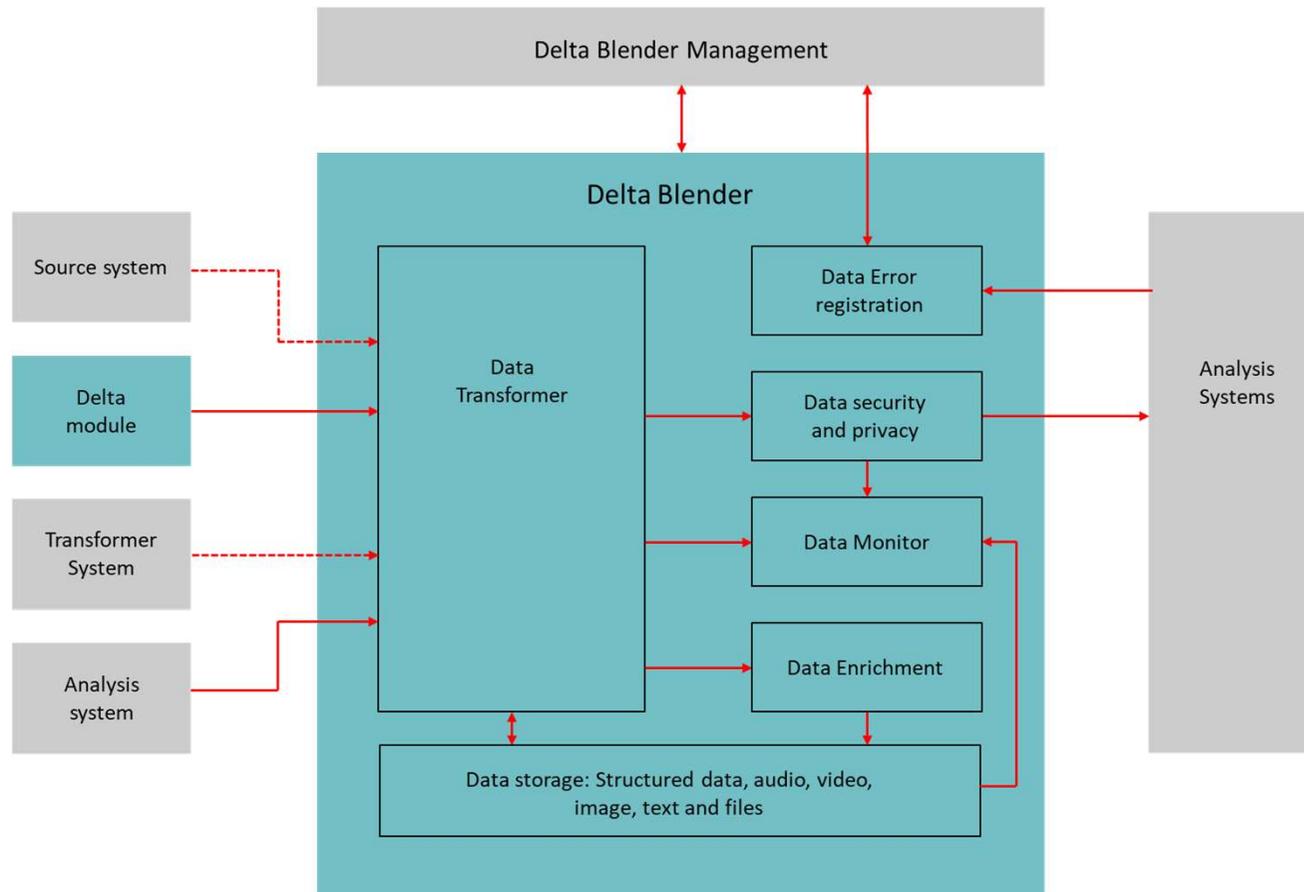

Transforming Data in Delta Blender

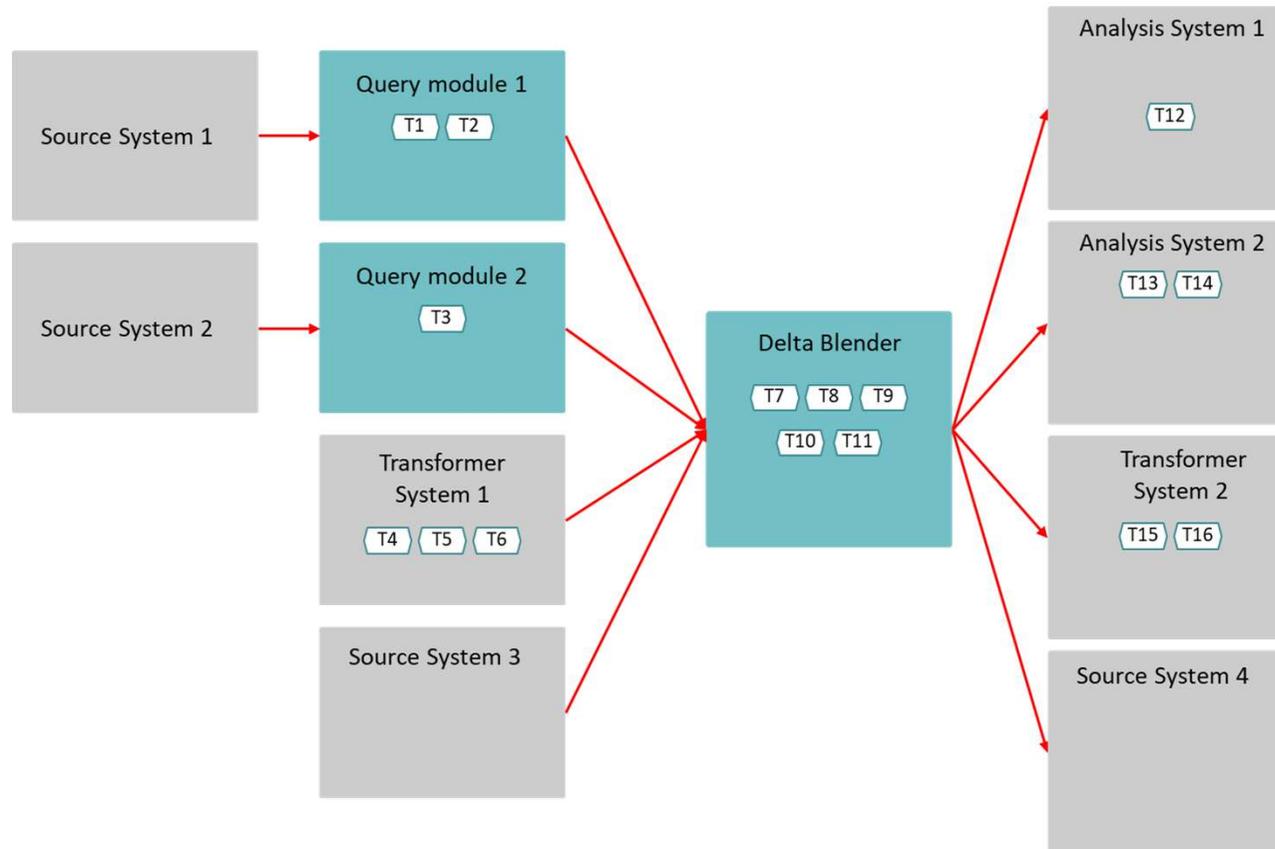

Files Hidden Behind Delta Modules

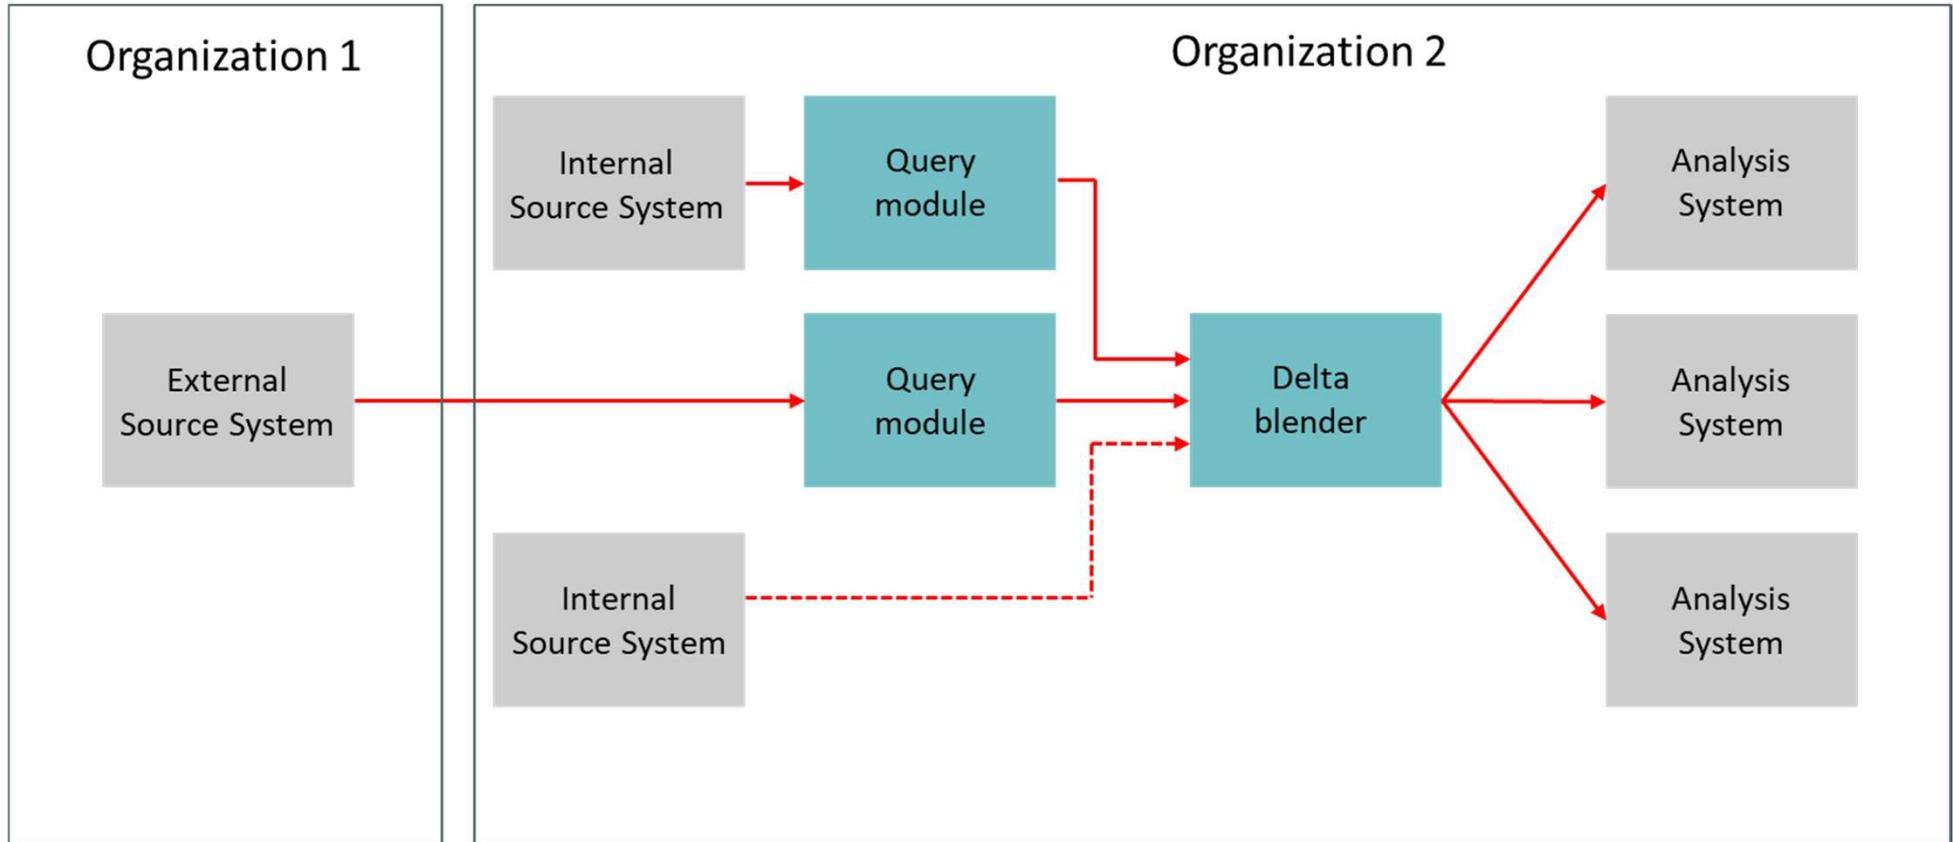

Delta Blender Components

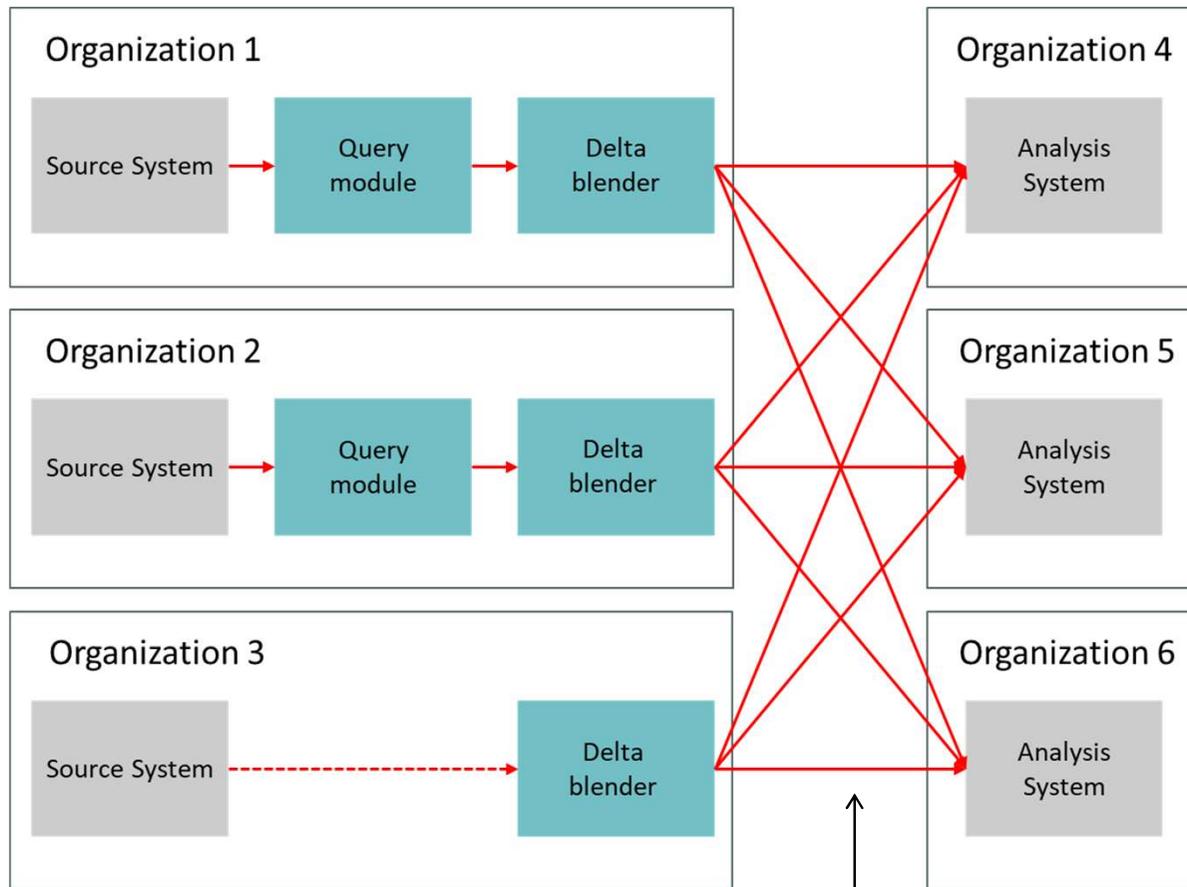

Delta Blender: Transformers

Local Federative Data Architecture

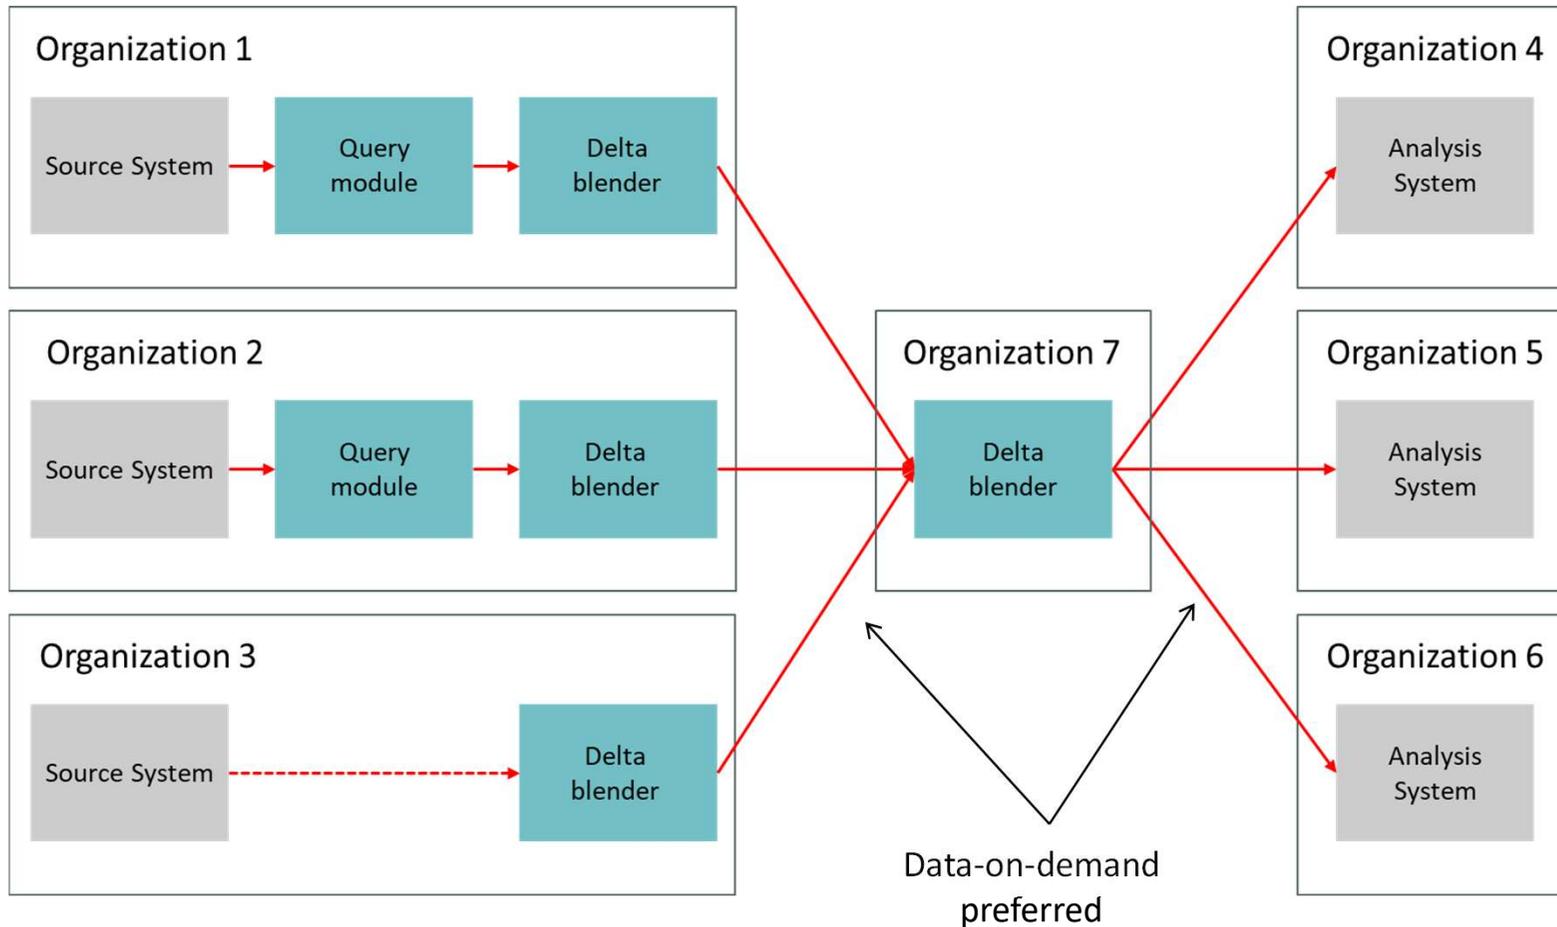

No Federative Data Architecture

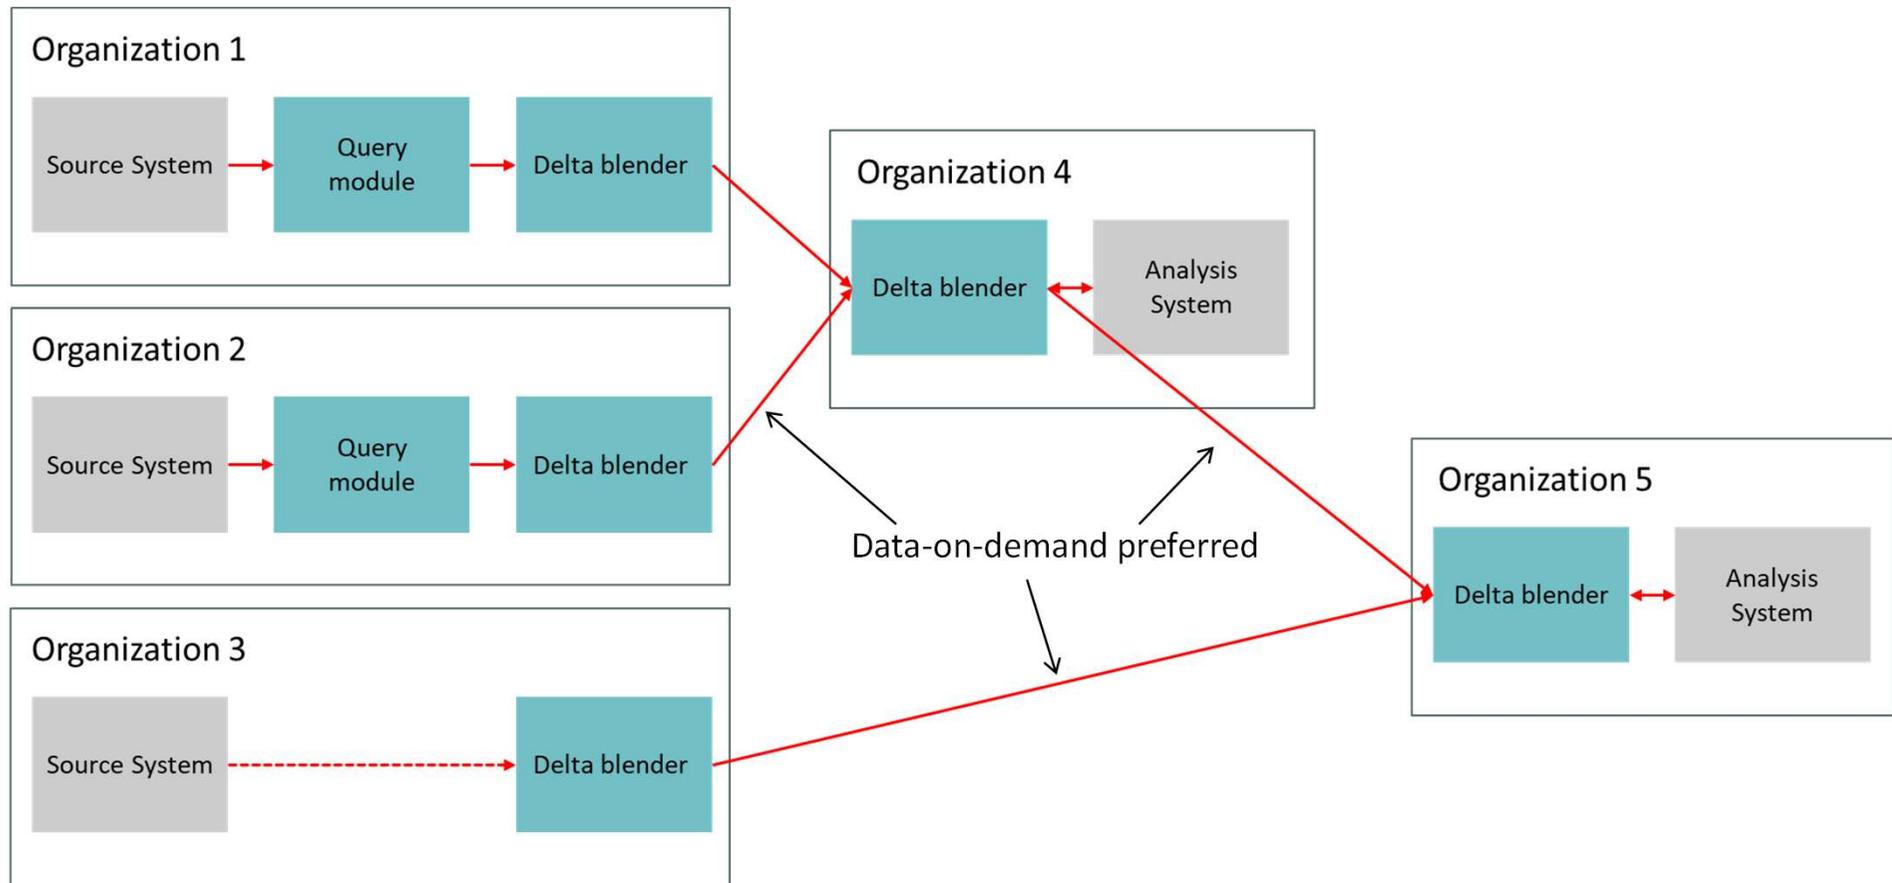

Data-on-demand preferred

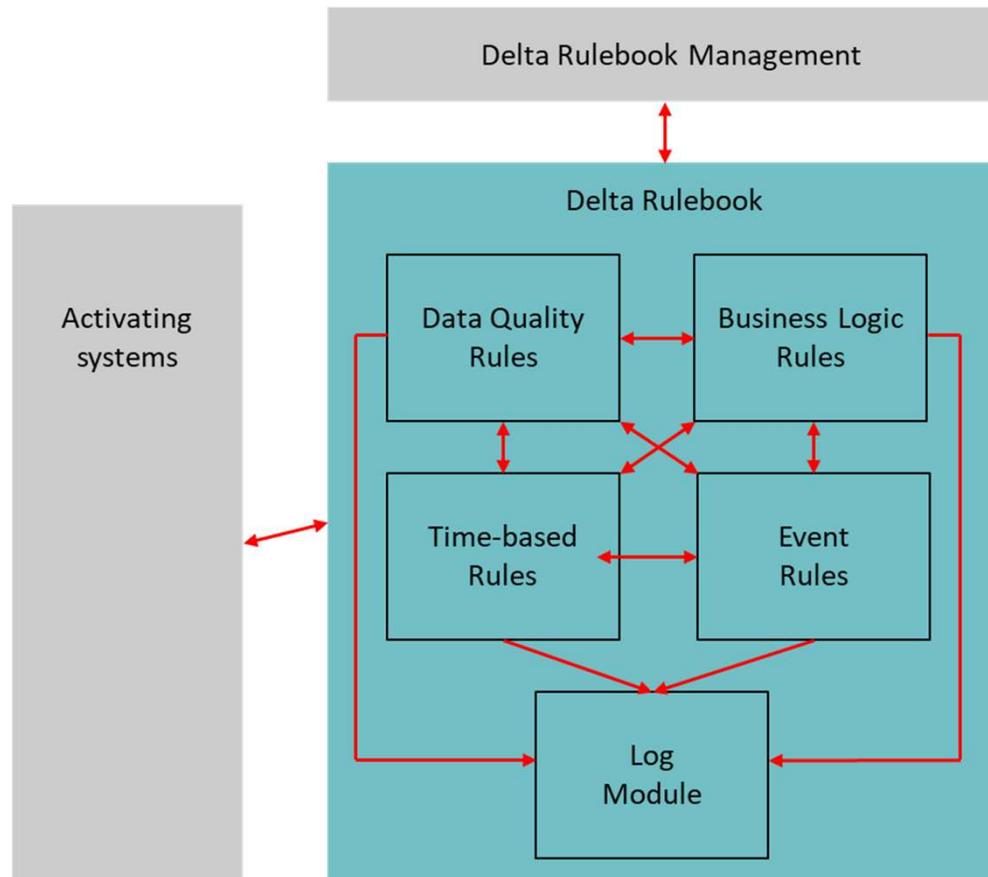

Global Federative Data Architecture

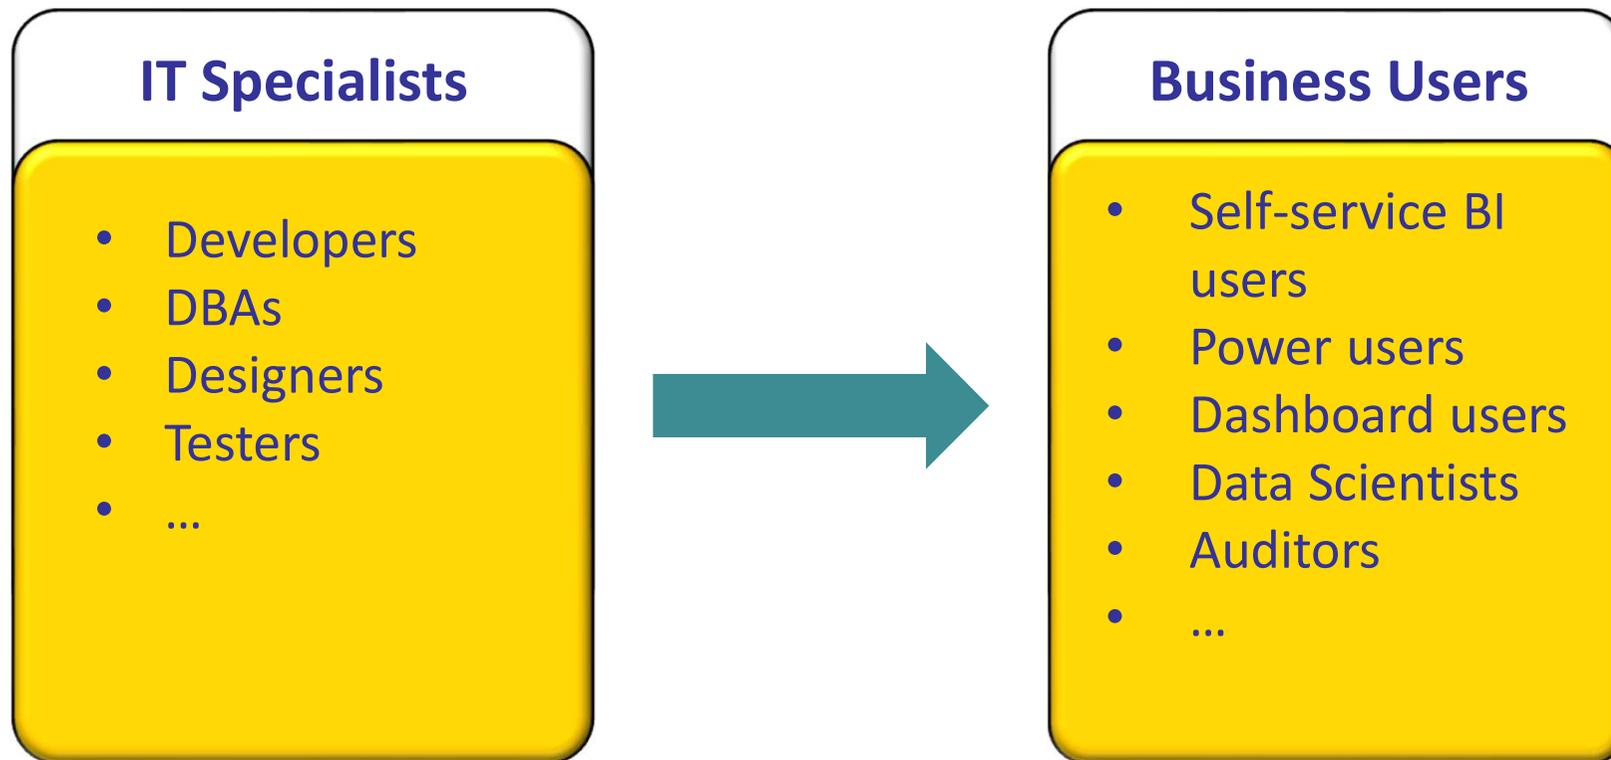

Layered Globale Federative Data Architecture

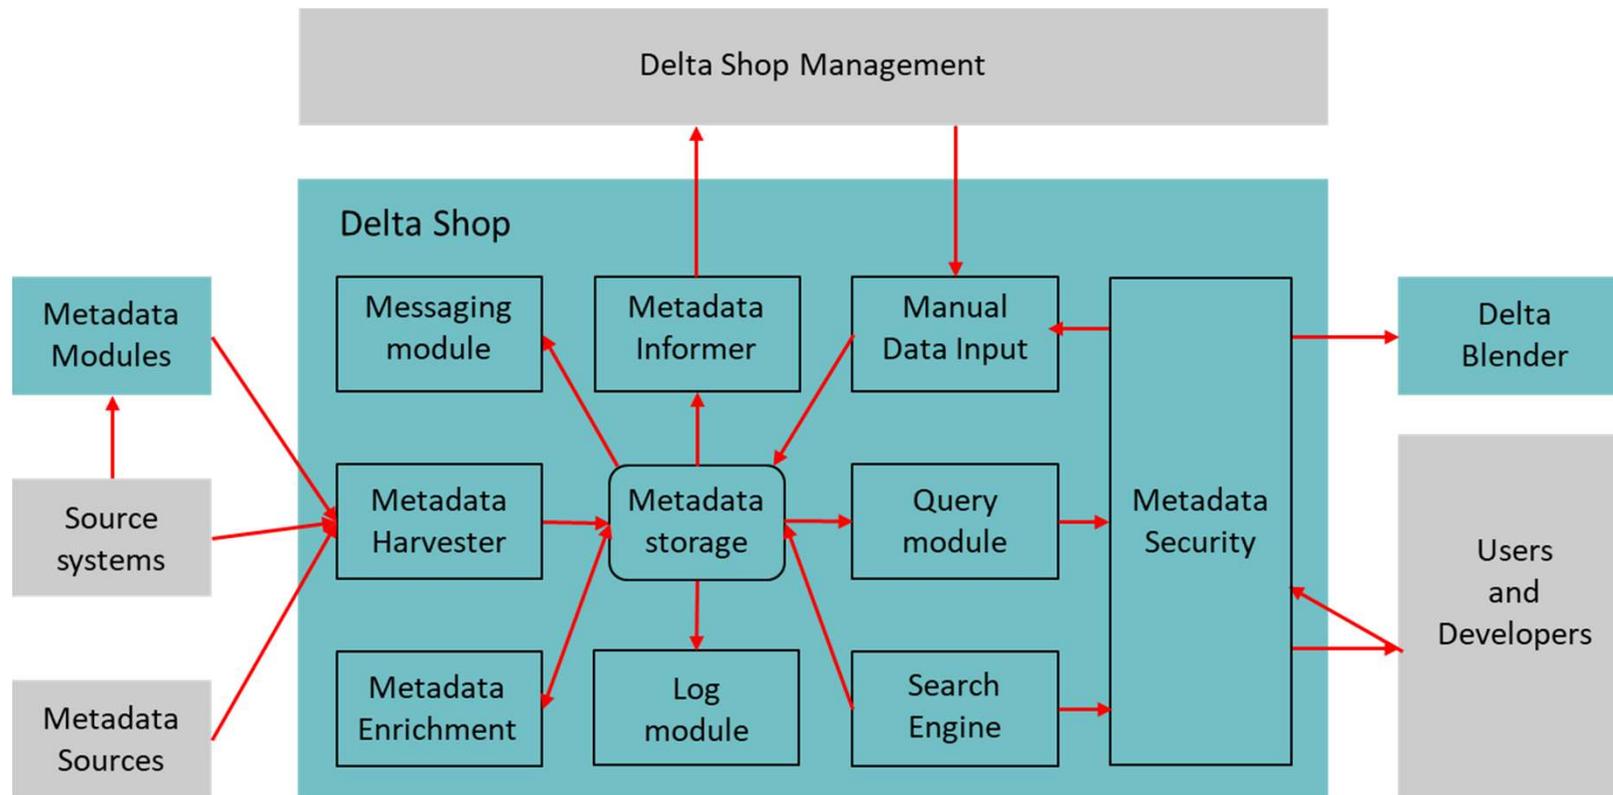

Delta Rulebook Components

Target Audience of Metadata Has Changed

Delta Shop Components

Summary

- Unbridled creation of data copies must stop
- Requirement: the (data)house must be in order
- A good (data)house starts with a holistic data architecture
 - Federated data architecture
 - Enterprise data architecture
 - The system is formed by the transformers, not the collection of databases
 - Avoid duplicate transformers
 - Data must be ready-to-use, findable, and insightful
 - Metadata for everyone
 - Operational lineage for reconstruction, transparency, and auditability

De Delta data-architectuur: van bron tot inzicht
